INTRODUCTION & OBJECTIVES

- Retrospective claims analyses are fundamental to HEOR research
- Payer-sourced, fully adjudicated "closed claims" datasets are the preferred data source for these analyses given their longitudinal capture of patient interactions with the healthcare system; however, often, only clearinghouse-sourced "open claims" data, are available
- When "open claims" are utilized, activity criteria are often employed potentially biasing outcomes
- This study aims to quantify the potential inadequacies of open claims data and identify corrective strategies (activity criteria) to enhance the reliability open claims relative to gold-standard closed claims in outcomes research

METHODS

OVERVIEW & DATA SOURCES

Study evaluated adult T2D patients' healthcare resource utilization (HCRU) across various SoC (IP, ER, OP, Office) with matched cohorts using:

- Open claims (Symphony Healthcare)
- Closed claims (Merative MarketScan)

QUALIFICATION CRITERIA

Study Period

• Jan 1st to Dec 31st, 2023

Patient Identification:

 2+ ICD-10 T2D diagnoses 30+ days apart during study period

Closed Claims Enrollment Requirements

 Patients had 12 months of continuous enrollment following first T2D diagnosis

Open Claims Activity Criteria

For patients identified using Symphony open claims, 3 separate patient cohorts were created

- 1. Requiring all-cause activity annually
- 2. Requiring all-cause activity semesterly
- 3. Requiring all-cause activity quarterly

EVALUATION METRICS

Ask A Question:

- T2D Visit Rate (IP, OP, ER, Office)
- T2D Average Annual Visits (IP, OP, ER, Office)

RESULTS

Overview of Medical Claims Generation and Clearing House Operations Figure 1

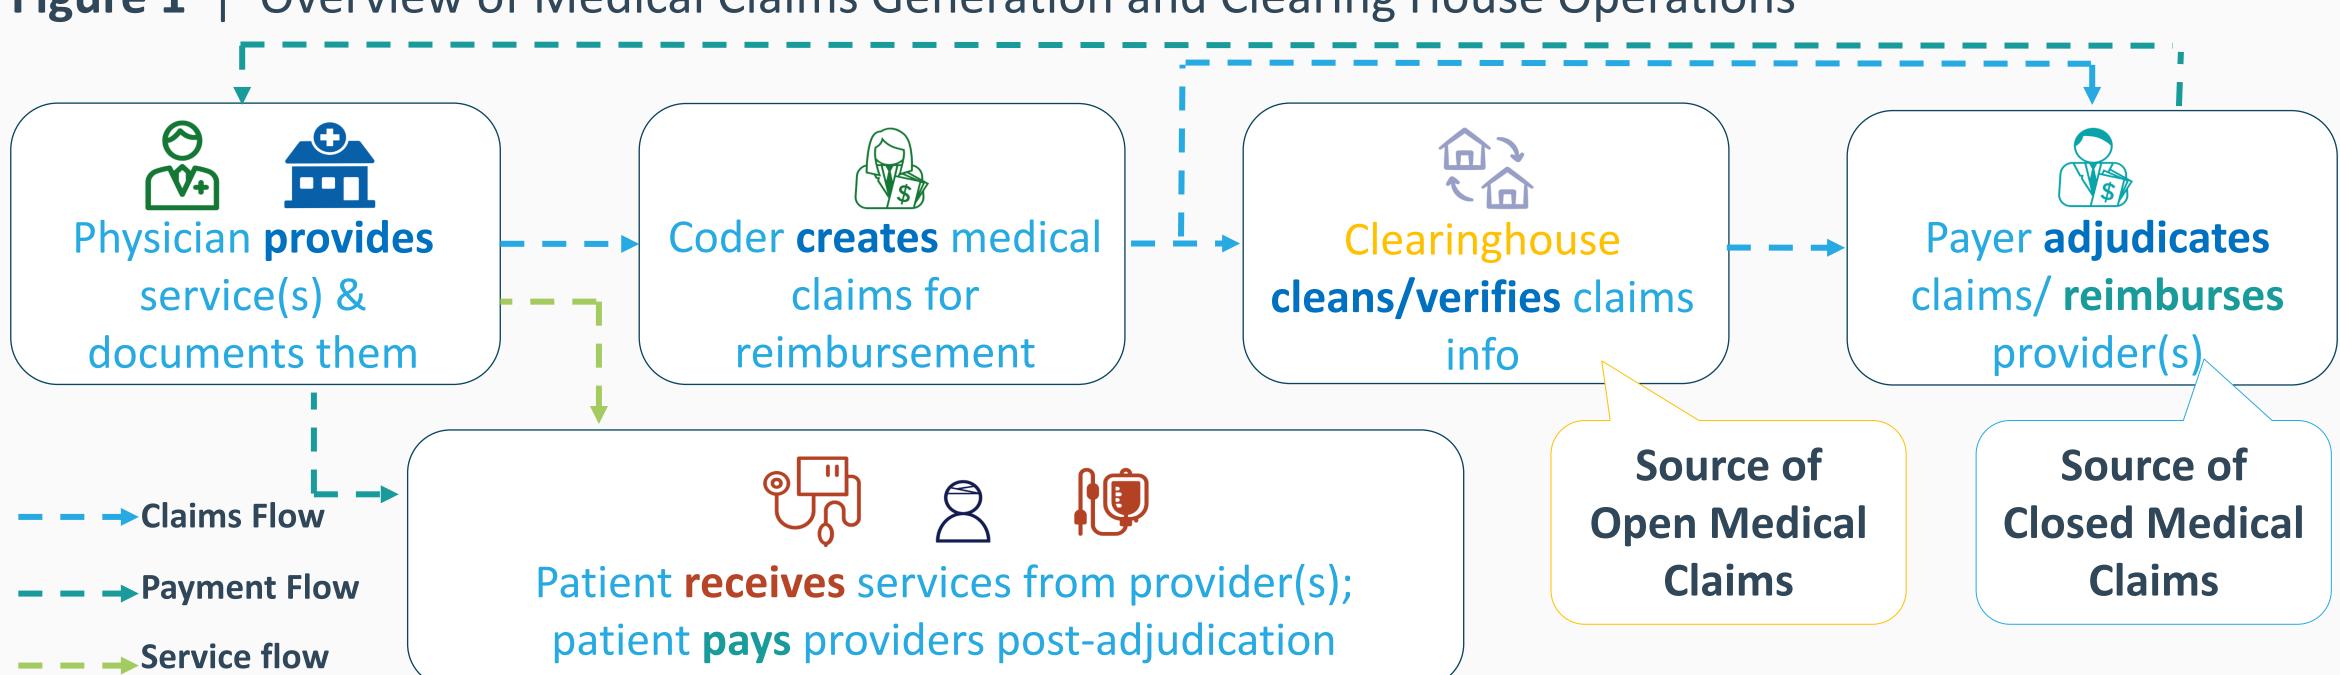

Figure 1: Closed medical claims within Merative Marketscan are sourced from self-insured employers and health plans while open claims are sourced at clearinghouses; Medicare advantage or Medicare supplement patients were excluded

Figure 2 | Matched Cohort Results

Patient Cohorts	MarketScan Closed Claims	SHA Open Claims Annual Activity	SHA Open Claims Semi-Annual Activity	SHA Open Claims Quarterly Activity
Matched Cohort	529,223	529,223	529,223	529,223
Males	53%	53%	53%	53%
Females	47%	47%	47%	47%
18-34	4%	4%	4%	4%
35-54	12%	12%	12%	12%
55-64	52%	52%	52%	52%
65+	<1%	<1%	<1%	<1%

Figure 2: Qualifying Marketscan closed claims patients were matched with SHA open claims patients at a 1:1 ratio based on demographic profile; analysis focused on commercial medical claims for adult patients only

Figure 3 | T2D Visit Rate and Frequency, Merative MarketScan Closed Claims vs. SHA Comparator

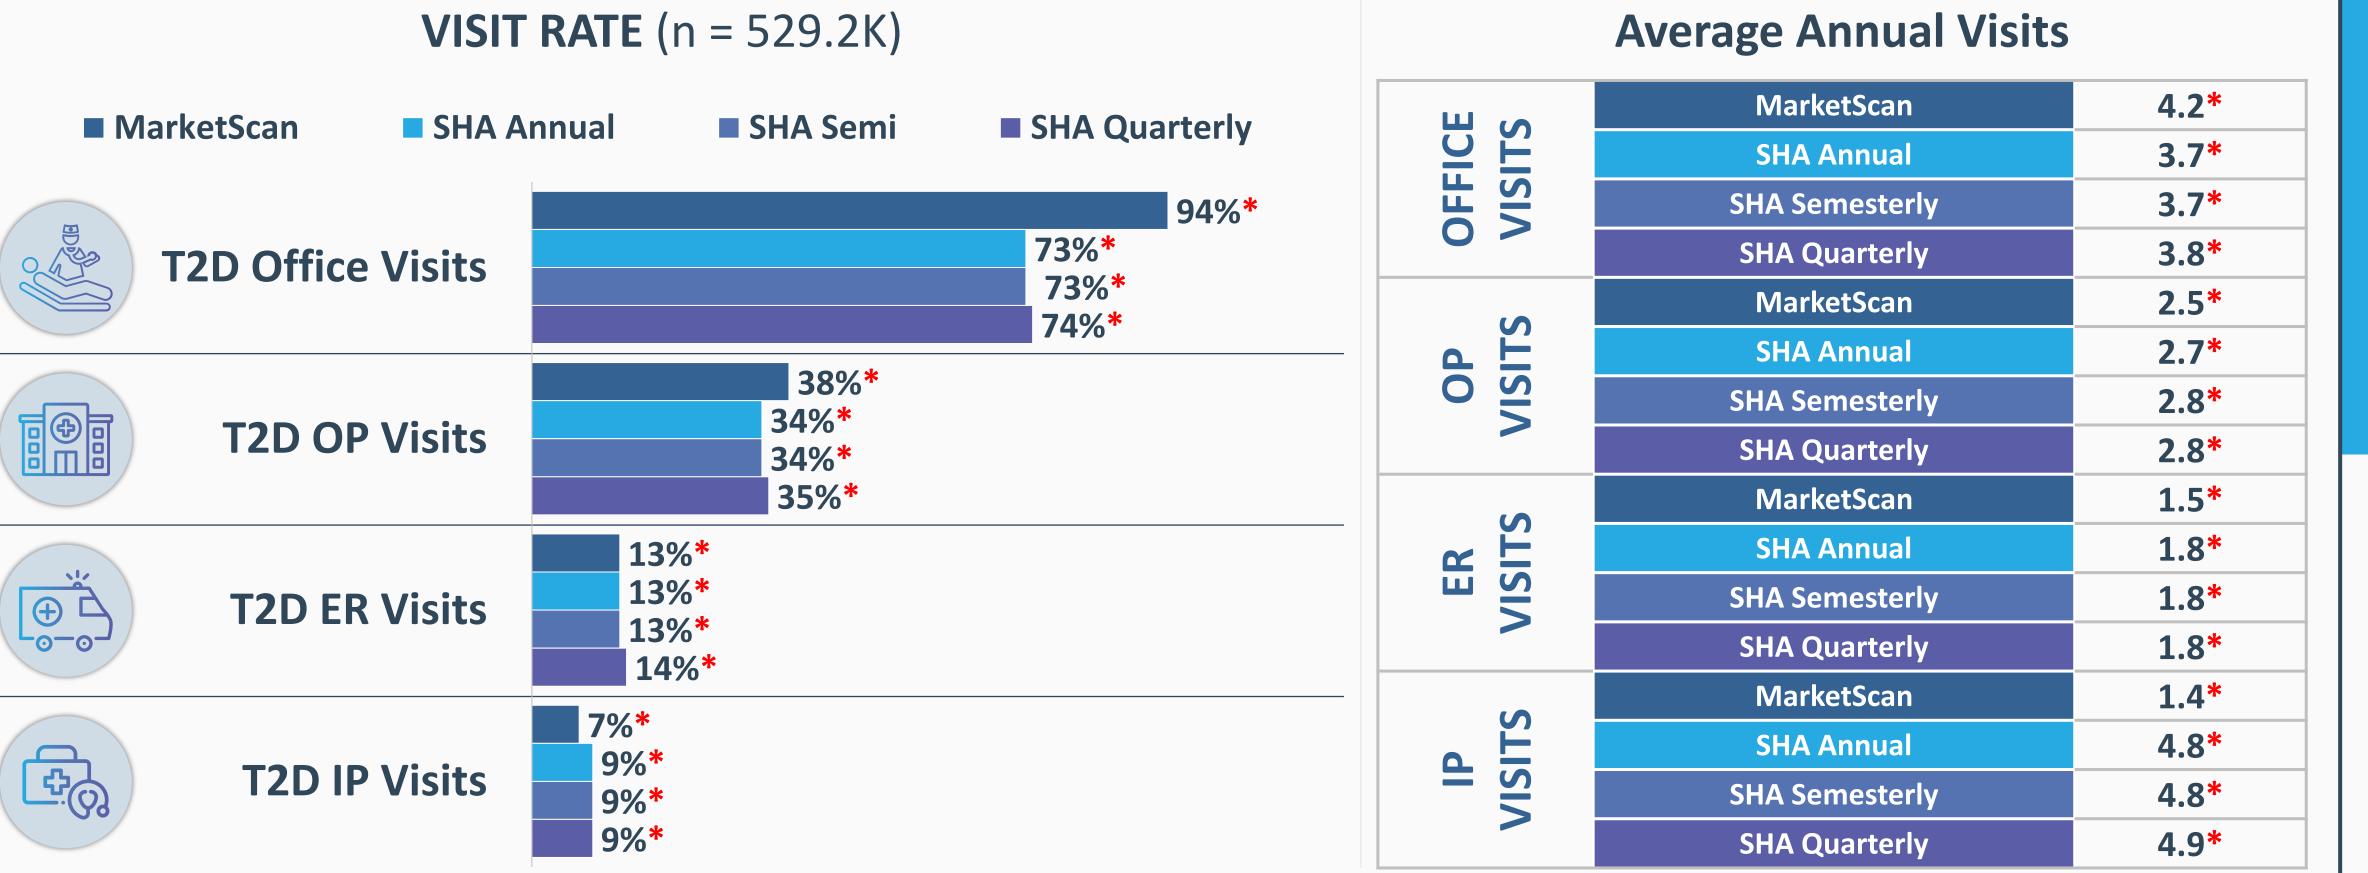

Figure 3: Matched cohorts were evaluated for utilization rates and visit frequency across different settings of care for T2D. *Statistically Significant Difference (P<.05)

SUMMARY

- Limited differentiation in T2D engagements were observed across activity criteria cohorts (quarterly, semesterly, annual); T2D visit rates were within ± 15% IP, OP, and ER visits, but not for office visits
- Office visits appeared to be under captured within open claims compared to closed claims, even with activity criteria applied

RESULTS

- 1. Office visit rate was significantly lower for open claims cohorts vs. closed (94% vs. 73%)
- 2. Visit rate for IP, ER, and OP settings were within ±15% for all cohorts
- 3. Average annual IP visits were ~340% higher for open claims cohorts than closed (4.8 vs. 1.4 annually)

DISCUSSION

- Open claims appear to have less significant capture of patient encounters at certain SoC
- Patients identified in open claims using an activity criteria possibly skew towards a more ill population as evidenced by higher the average rate of IP visits
- Varying the activity criteria for patients identified in open claims appears to have minimal effects on the capture of patient interactions given low variance in average visits and rates of SoC utilization

CONCLUSIONS

- 1. Open claims with activity criteria could not fully replicate the capture of closed claims
- 2. Endpoints are less sensitive to activity criteria than dataset selection
- 3. Open claims may suffice in some analyses depending on SoC of interest, particularly as a supplement / benchmark to closed claims

LIMITATIONS

Trinity did not present findings for all-cause interactions, given biases resulting from requirement of all-cause interaction within open claims cohorts
