INTRODUCTION

- Osteogenesis imperfecta (OI)**
- Rare genetic disorder
 - Standard of care: bisphosphonates
 - Emerging therapies: biologics (mechanism-targeted; evidence fragmented)
 - Objective: To systematically evaluate the effectiveness and safety of biologics in OI using artificial intelligence (AI)-assisted evidence synthesis.

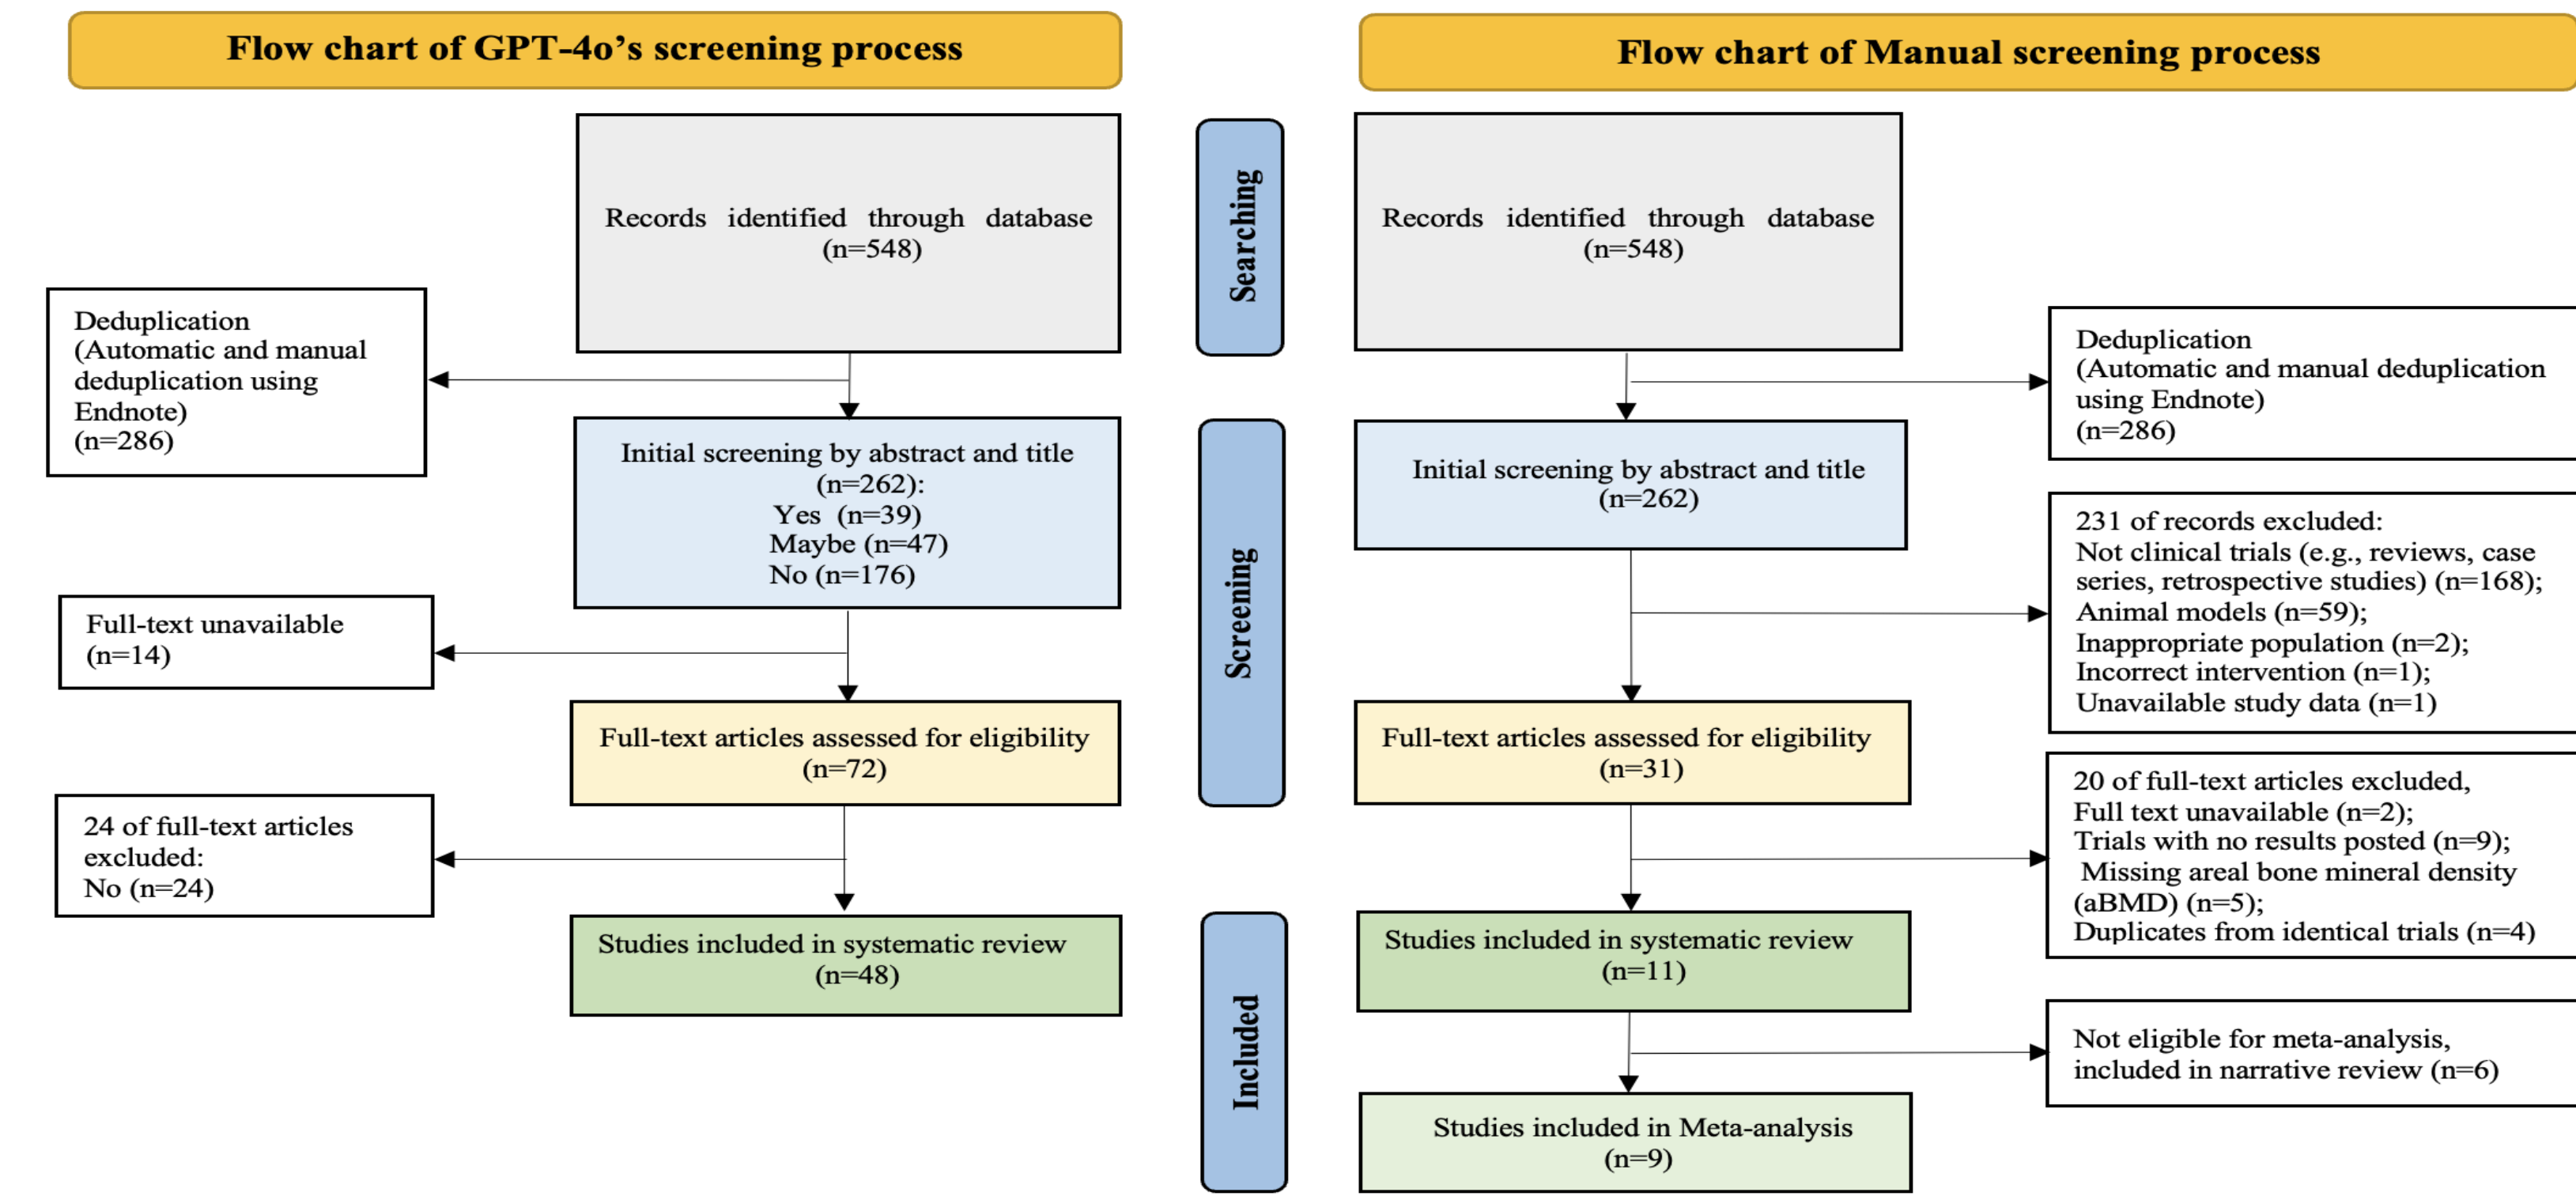

METHOD

- Systematic review and random-effects meta-analysis of trials on denosumab, setrusumab, teriparatide, and fresolimumab in OI.
- **Primary outcomes:** change (%) in areal bone mineral density (aBMD); fracture incidence; safety profiles.
- **AI-assisted workflow:** GPT-4o (2024-08-06 API) assisted title/abstract screening and risk-of-bias appraisal using rule-based prompts.
- **Performance validation:** Compared AI to human using sensitivity, specificity, and weighted Cohen's kappa.

RESULTS

- AI showed high sensitivity in abstract (96.8%) and full-text screening (90.9%), cut screening time by over 95%, and was ~100 times faster per article than humans.
- Agreement with humans in quality assessment was substantial (kappa = 0.806).

Note*: Assignment: effect of assignment to intervention; Missing data: missing outcome data; Measurement: measurement of the outcome; Selection: selection of the reported result.

Biologics on lumbar aBMD change (%) in OI children

Biologics on lumbar aBMD change (%) in OI adults

AI performance in literature Screening

| Document type | | Human | | | Sensitivity (TP/[TP+FN]) | Specificity (TN/[TN+FP]) | Screening time (seconds/paper, mean ± SD) | Estimated time for manual screening (minutes/paper) |
|------------------|--------|----------|----------|-------|--------------------------|--------------------------|---|---|
| | | Positive | Negative | Total | | | | |
| Title & Abstract | GPT-4o | Positive | 30 | 56 | 86 | 96.8% | 75.8% | 3.50±0.14 |
| | | Negative | 1 | 175 | 176 | | | |
| | | Total | 31 | 231 | 262 | | | |
| Full-text | GPT-4o | Positive | 10 | 38 | 48 | 90.9% | 84.9% | 9.67±1.85 |
| | | Negative | 1 | 213 | 214 | | | |
| | | Total | 11 | 251 | 262 | | | |

Abbreviations: TP, true positive; FN, false negative; TN, false negative; FP, false positive

CONCLUSIONS

- GPT-4o enhances evidence synthesis by increasing screening efficiency and improving quality assessment, providing a scalable way to reduce manual workload; human oversight remains crucial for tasks that require contextual understanding and clinical reasoning.
- Denosumab and setrusumab effectively improve lumbar spine aBMD in OI, but current evidence does not confirm a reduction in fracture risk with biologics.
