Introduction

High Burden of Disease: Peripheral Neuropathy (ThalPN) is a significant and common complications in adults with thalassemia, affecting 20 - 78% of patients globally¹⁻³. In Penang, Malaysia, the prevalence is 25%.

Impact of Patients: ThalPN is often subclinical and underdiagnosed in early stages. The condition is frequently irreversible once established, leading to a significant reduction in quality of life.

Gap in Current Practice: Despite its impact, routine screening for ThalPN is not standard care. Crucially, no previous studies have analyzed the cost-effectiveness of screening to guide policy in resource-limited settings.

Objective

To evaluate the cost-effectiveness of a systematic routine screening (SRS) program for ThalPN compared to standard care (symptomatic diagnosis) for adult thalassemia patients in Malaysia from a healthcare payer perspective.

Methods

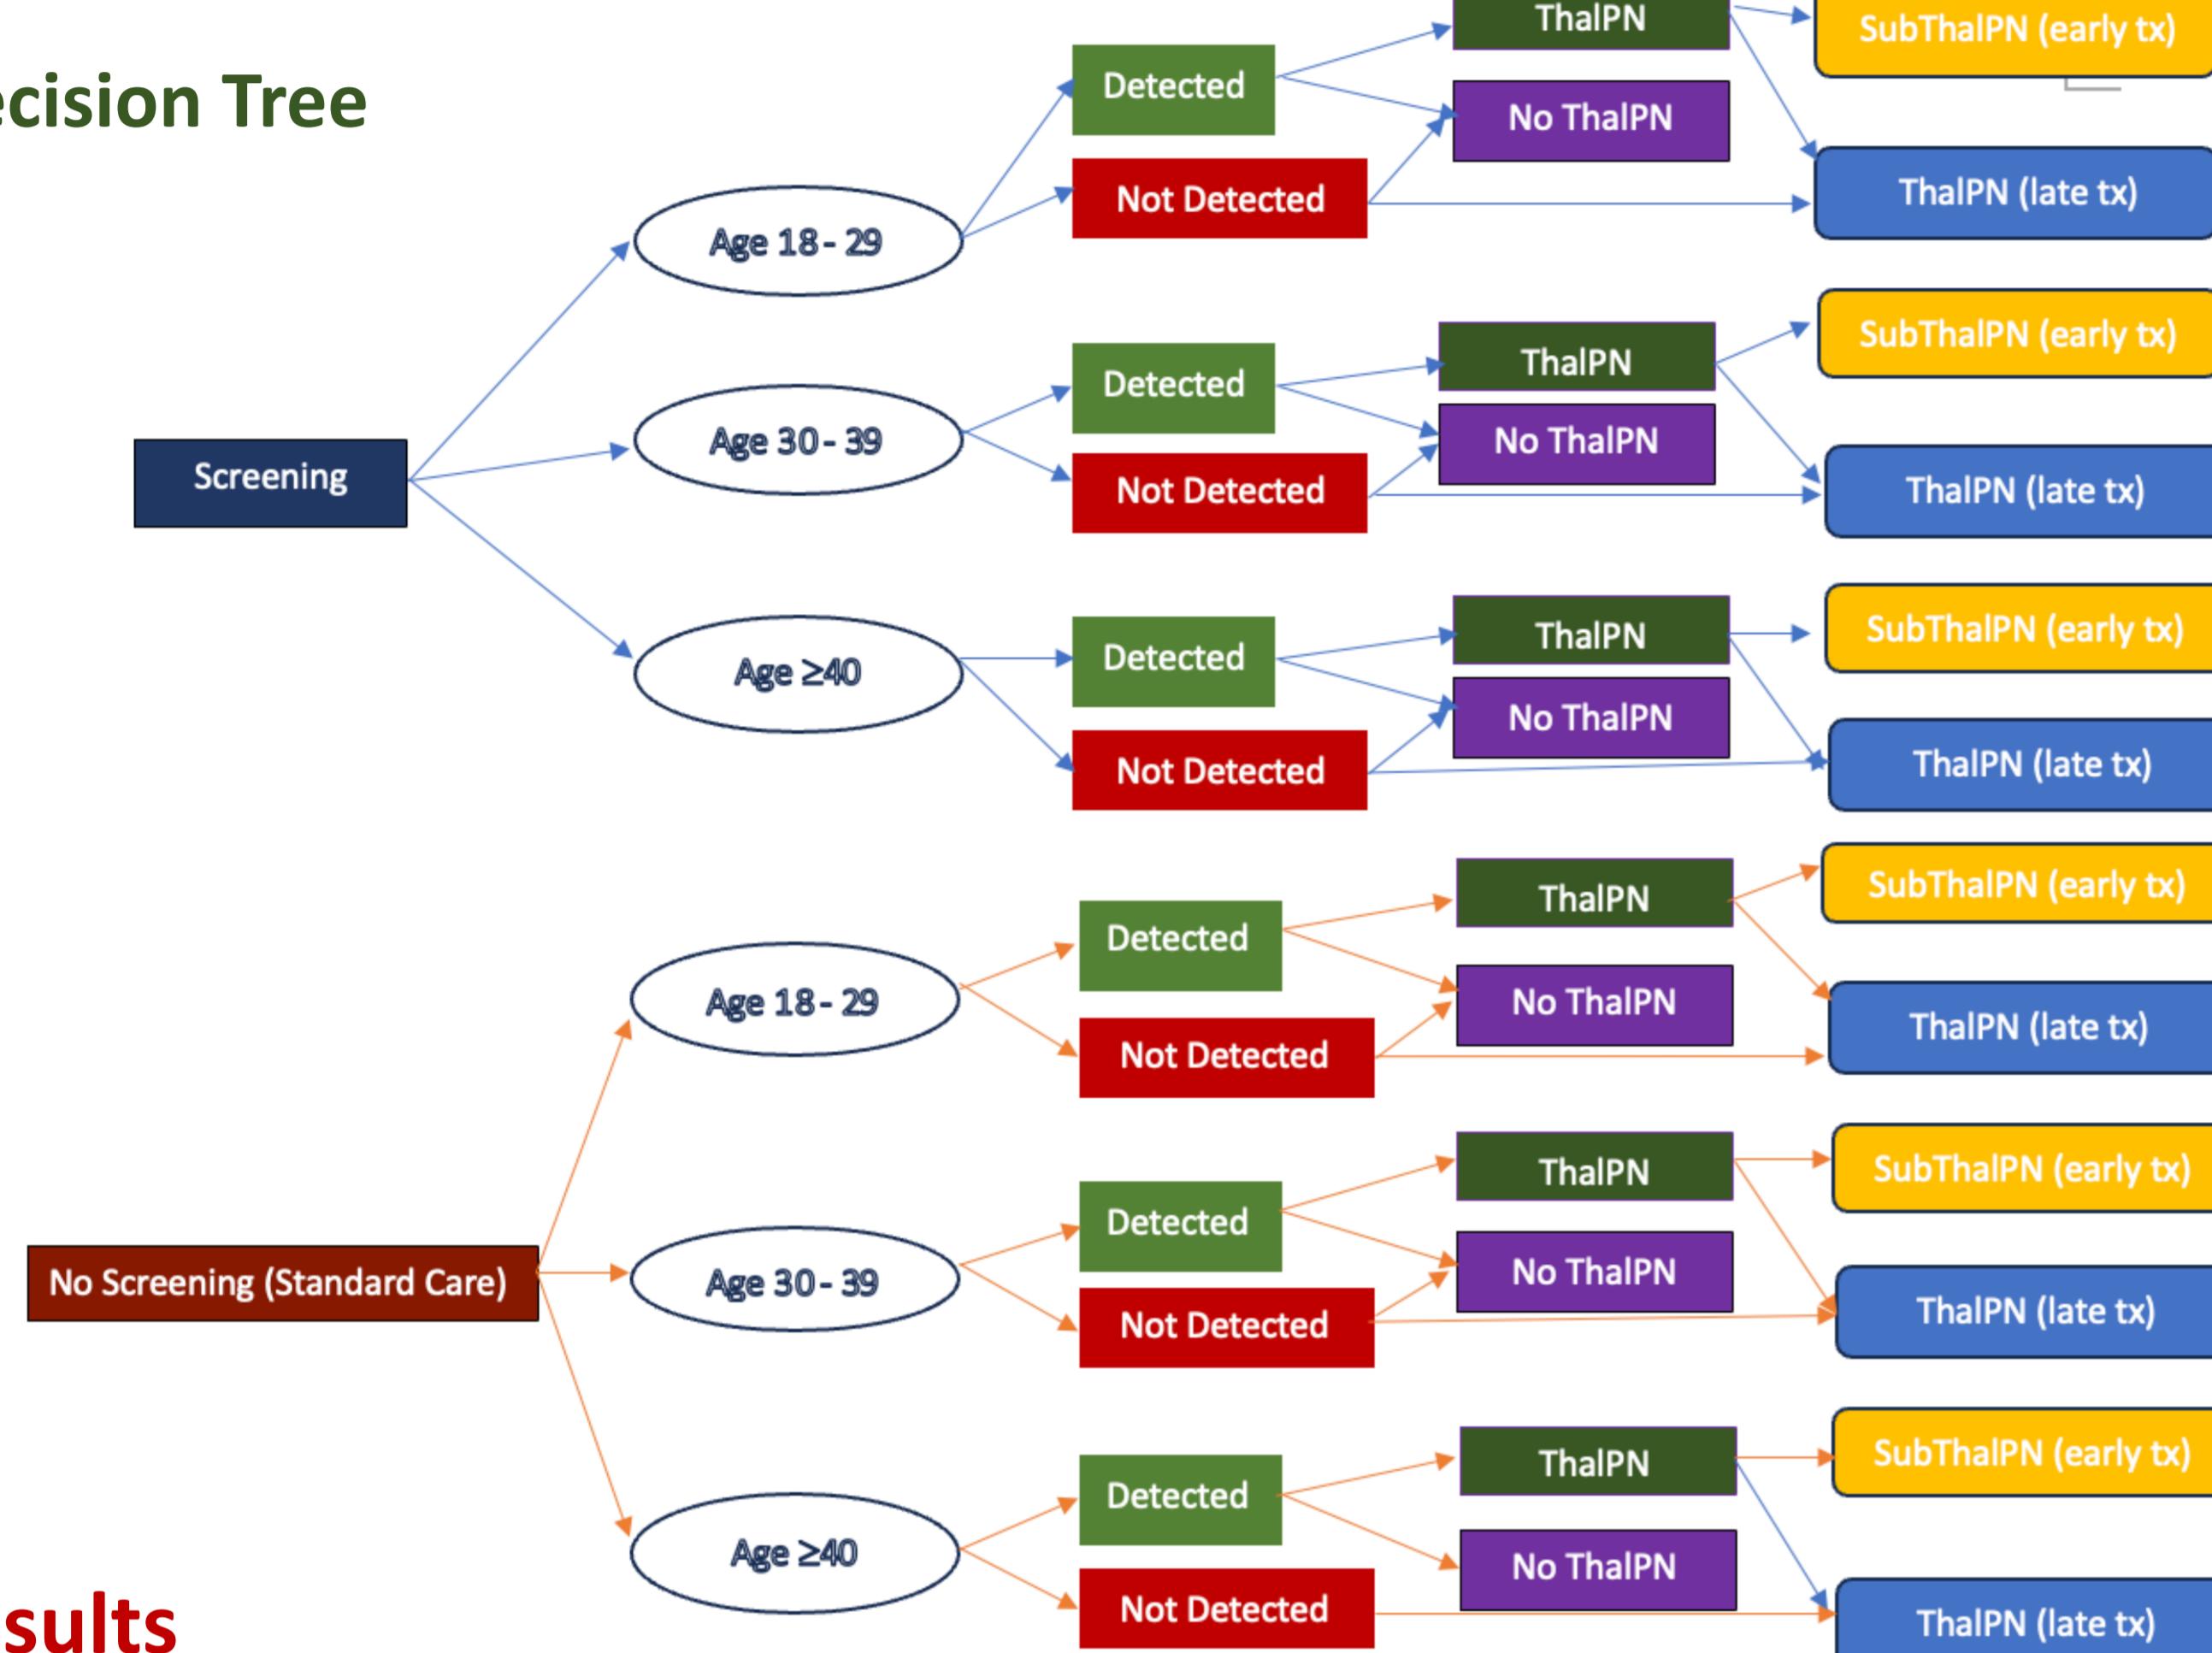

Model Structure: A dual-model approach was used.

Decision Tree: To model the initial screening and detection outcomes.

Lifetime Markov Model: To simulate the long-term progression of ThalPN through different health states with annual cycles.

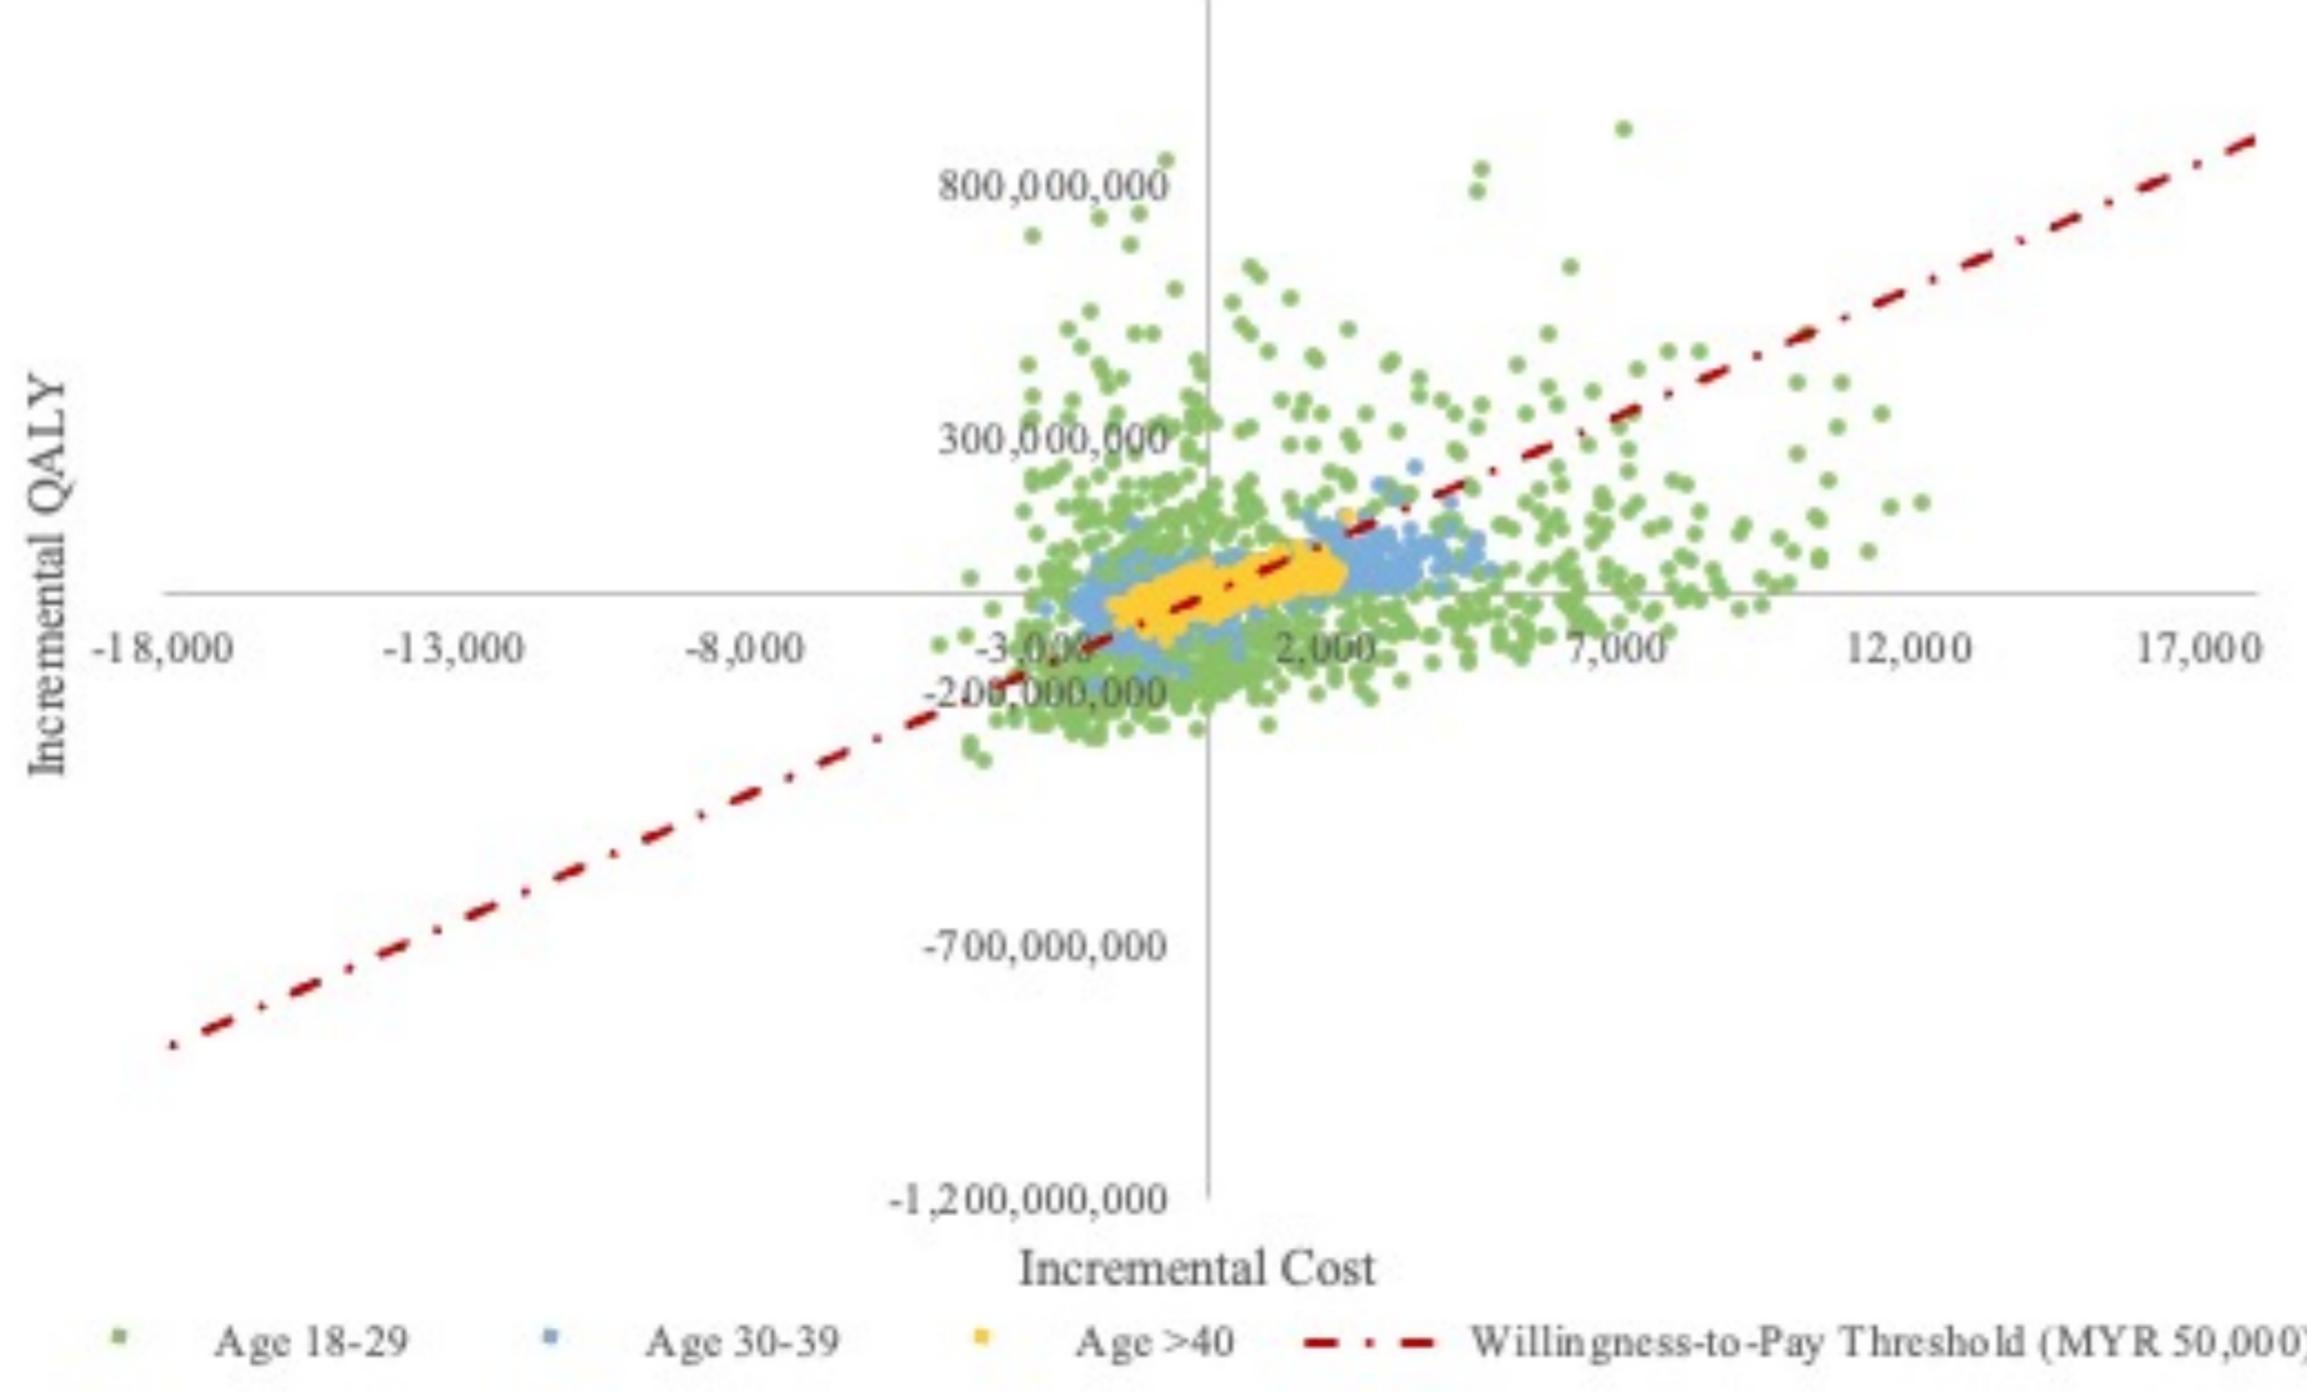

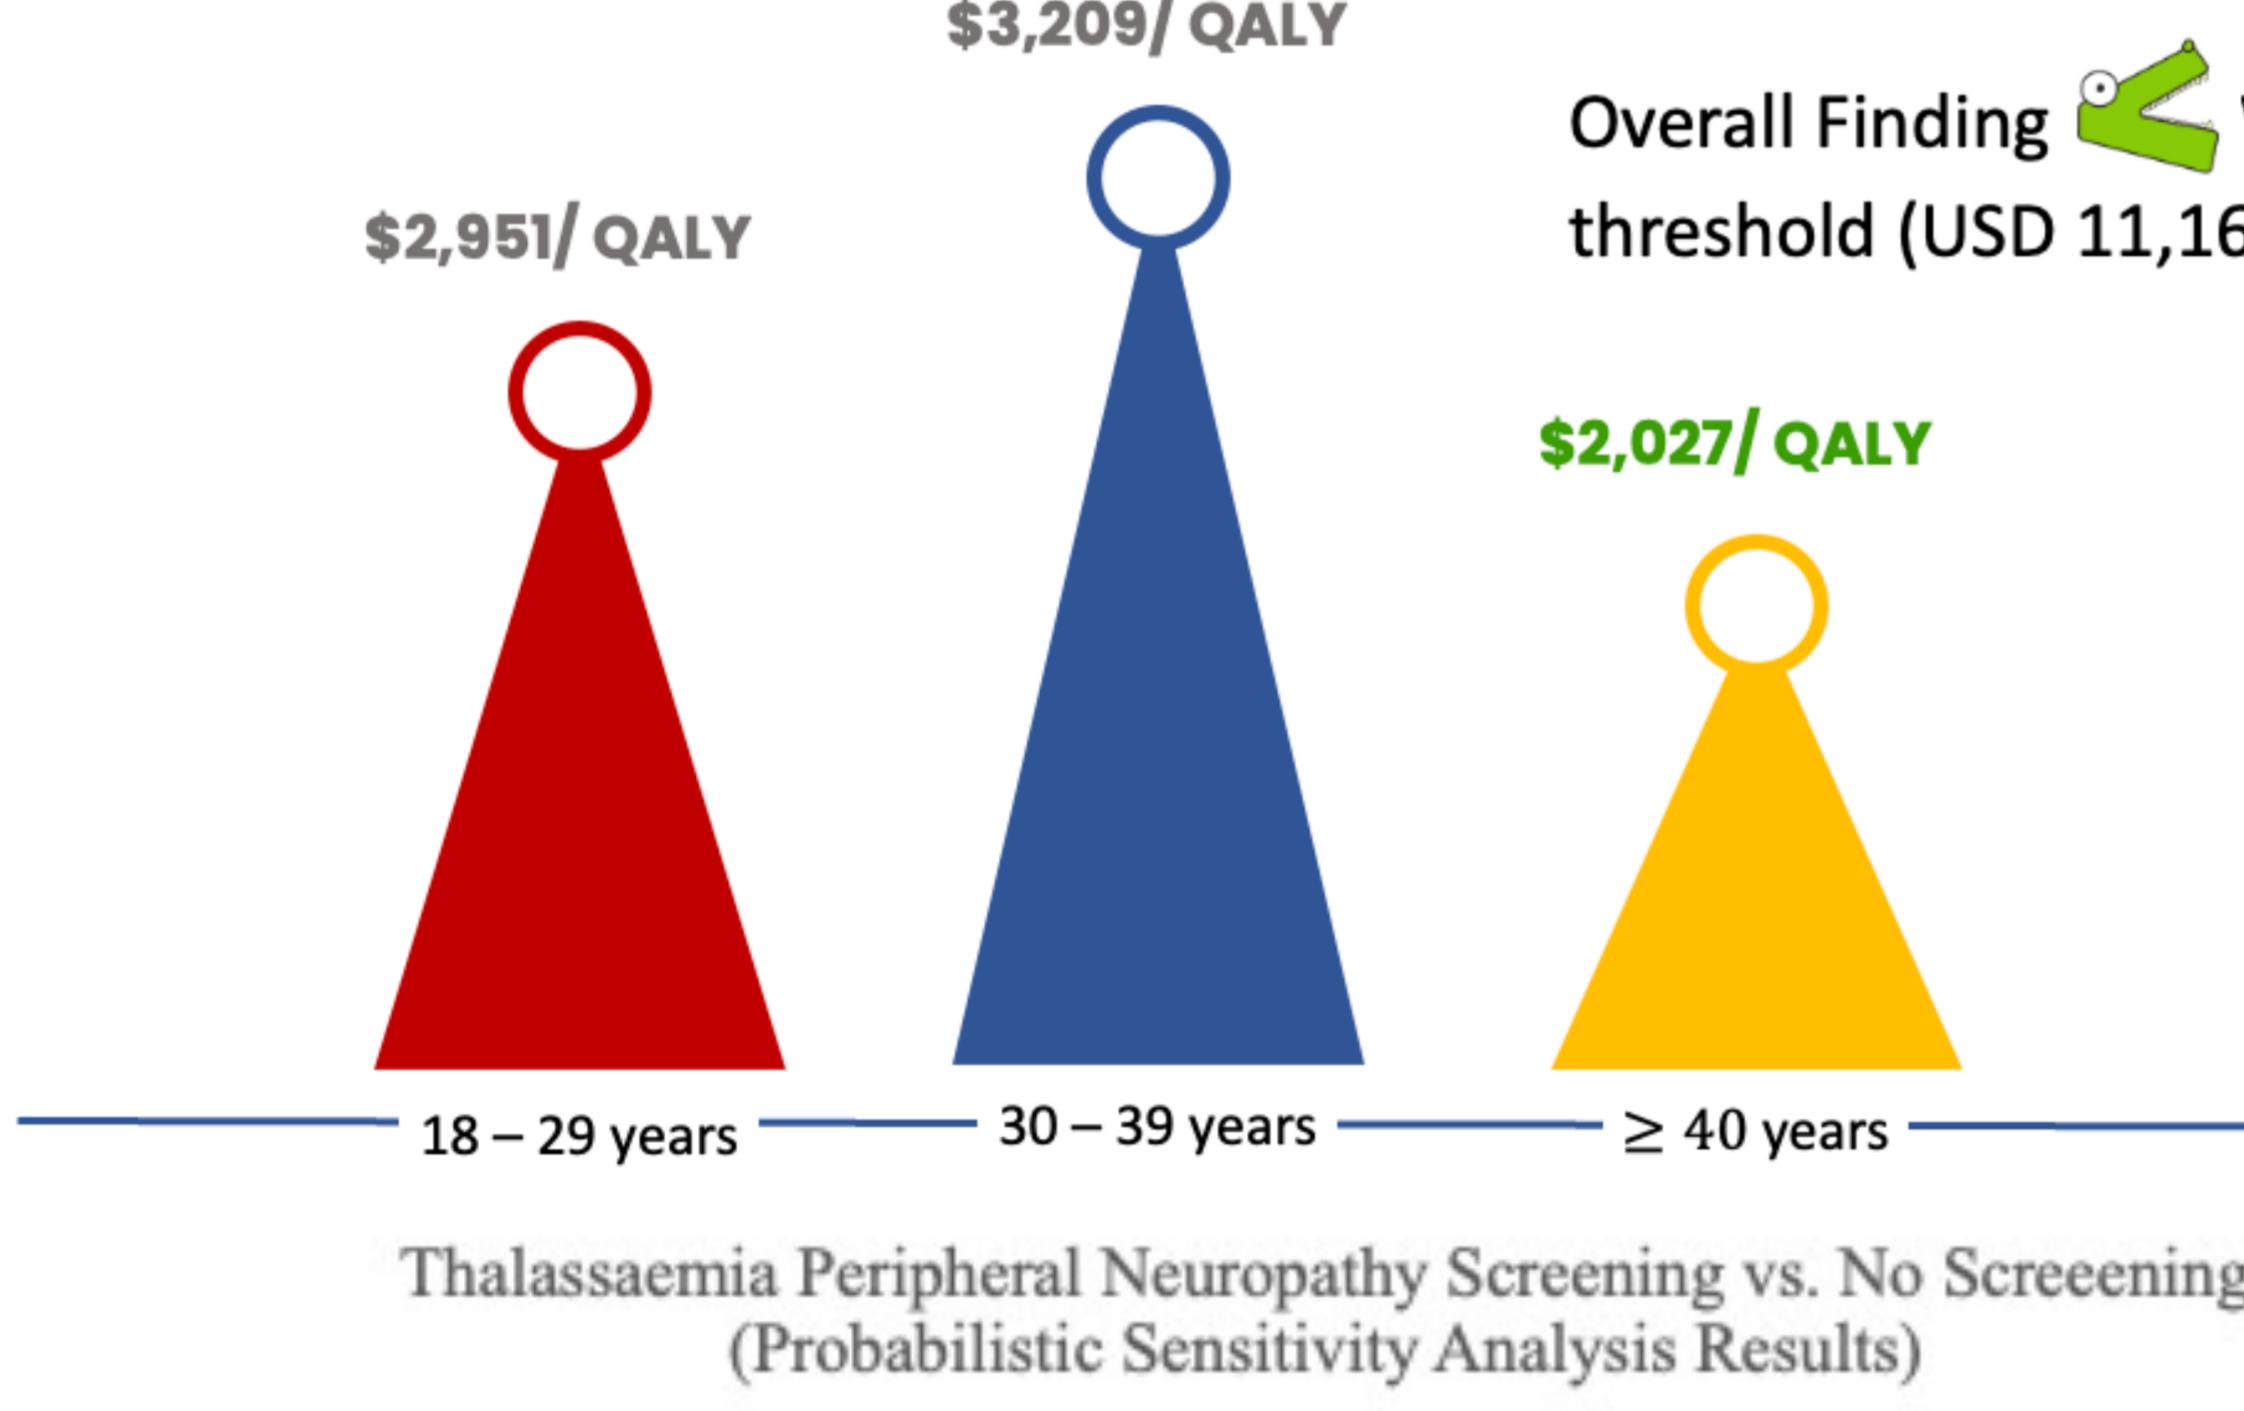

Uncertainty Analysis: One-way and Probabilistic Sensitivity Analyses (PSA) with 1,000 simulations were performed to assess uncertainty.

Decision Tree

Results

Base Case Results: Incremental Cost-Effectiveness Ratio (ICER) by Age Group

Probabilistic Sensitivity Analysis: Incremental Cost-Effectiveness Plane for Thalassaemia Peripheral Neuropathy Screening versus No Screening, by Age Group.

Abbreviation: QALY, Quality-adjusted Life Year

The CEA curve shows probabilities of **62%**, **58%**, and **68%** for the age groups 18-29, 30-39, and **≥40**, respectively.

Limitations

❖ The model relied on certain assumptions due to limited published data specifically on the long-term progression of ThalPN in thalassemia patients

❖ Parameters were validated by expert opinion where local data were unavailable

Abbreviation: QALYs, quality-adjusted life years, CEA, cost-effectiveness analysis

Parameter

Source: A local cohort study, Malaysia Thalassaemia Registry³, published literature ^{4,5}, and experts 'opinion

Perspective: Healthcare Payer

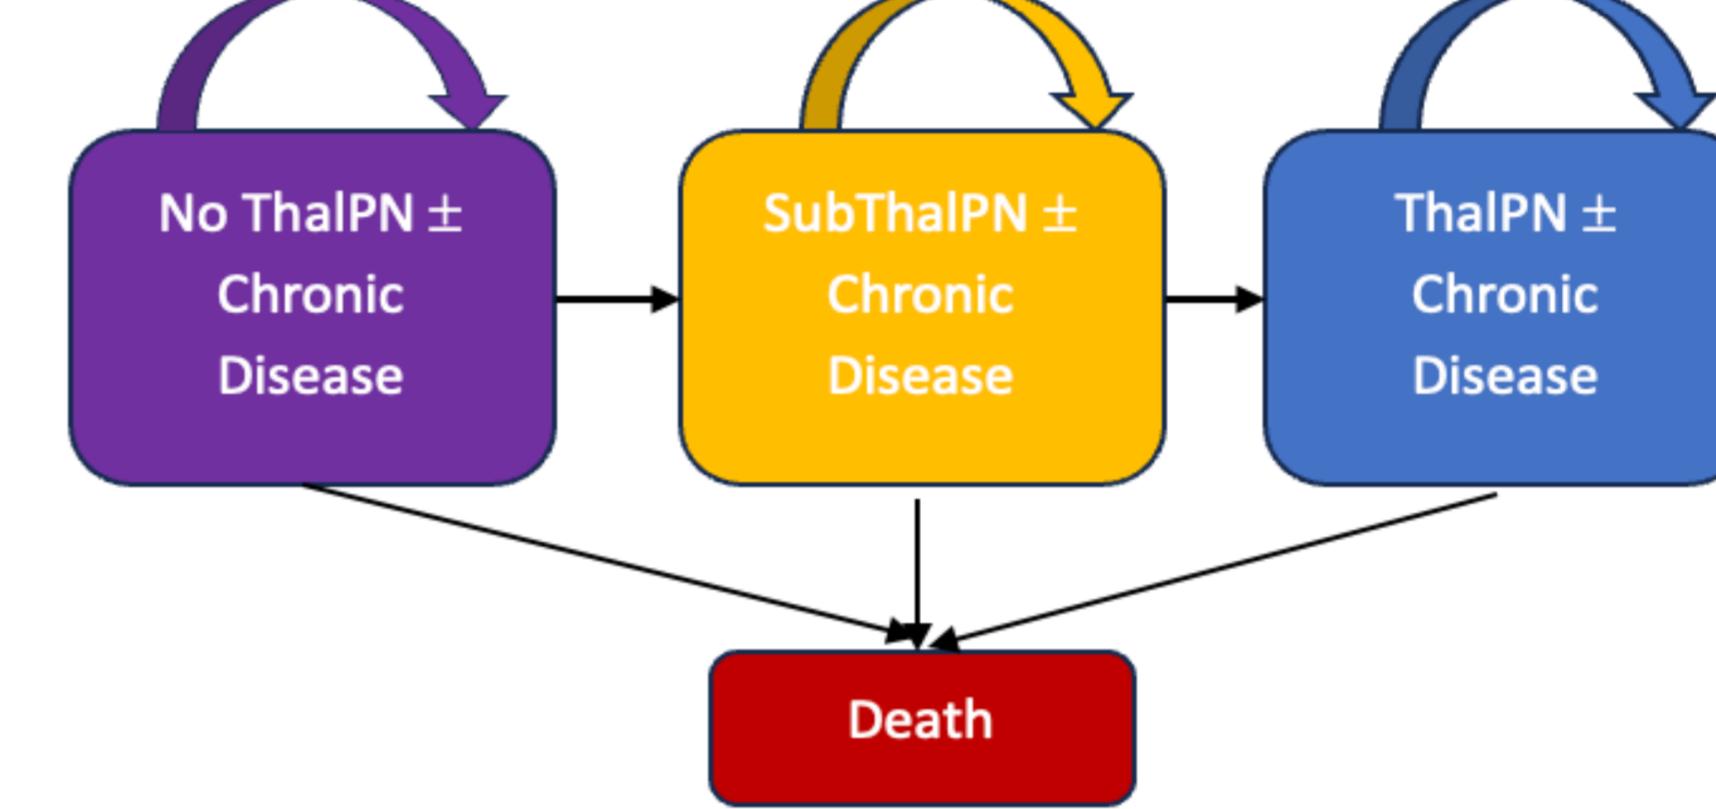

Population: Adult Thalassemia Patients (by age groups: 18 – 29, 30 – 39, ≥ 40)

Discount Rate: 3% for costs and outcomes

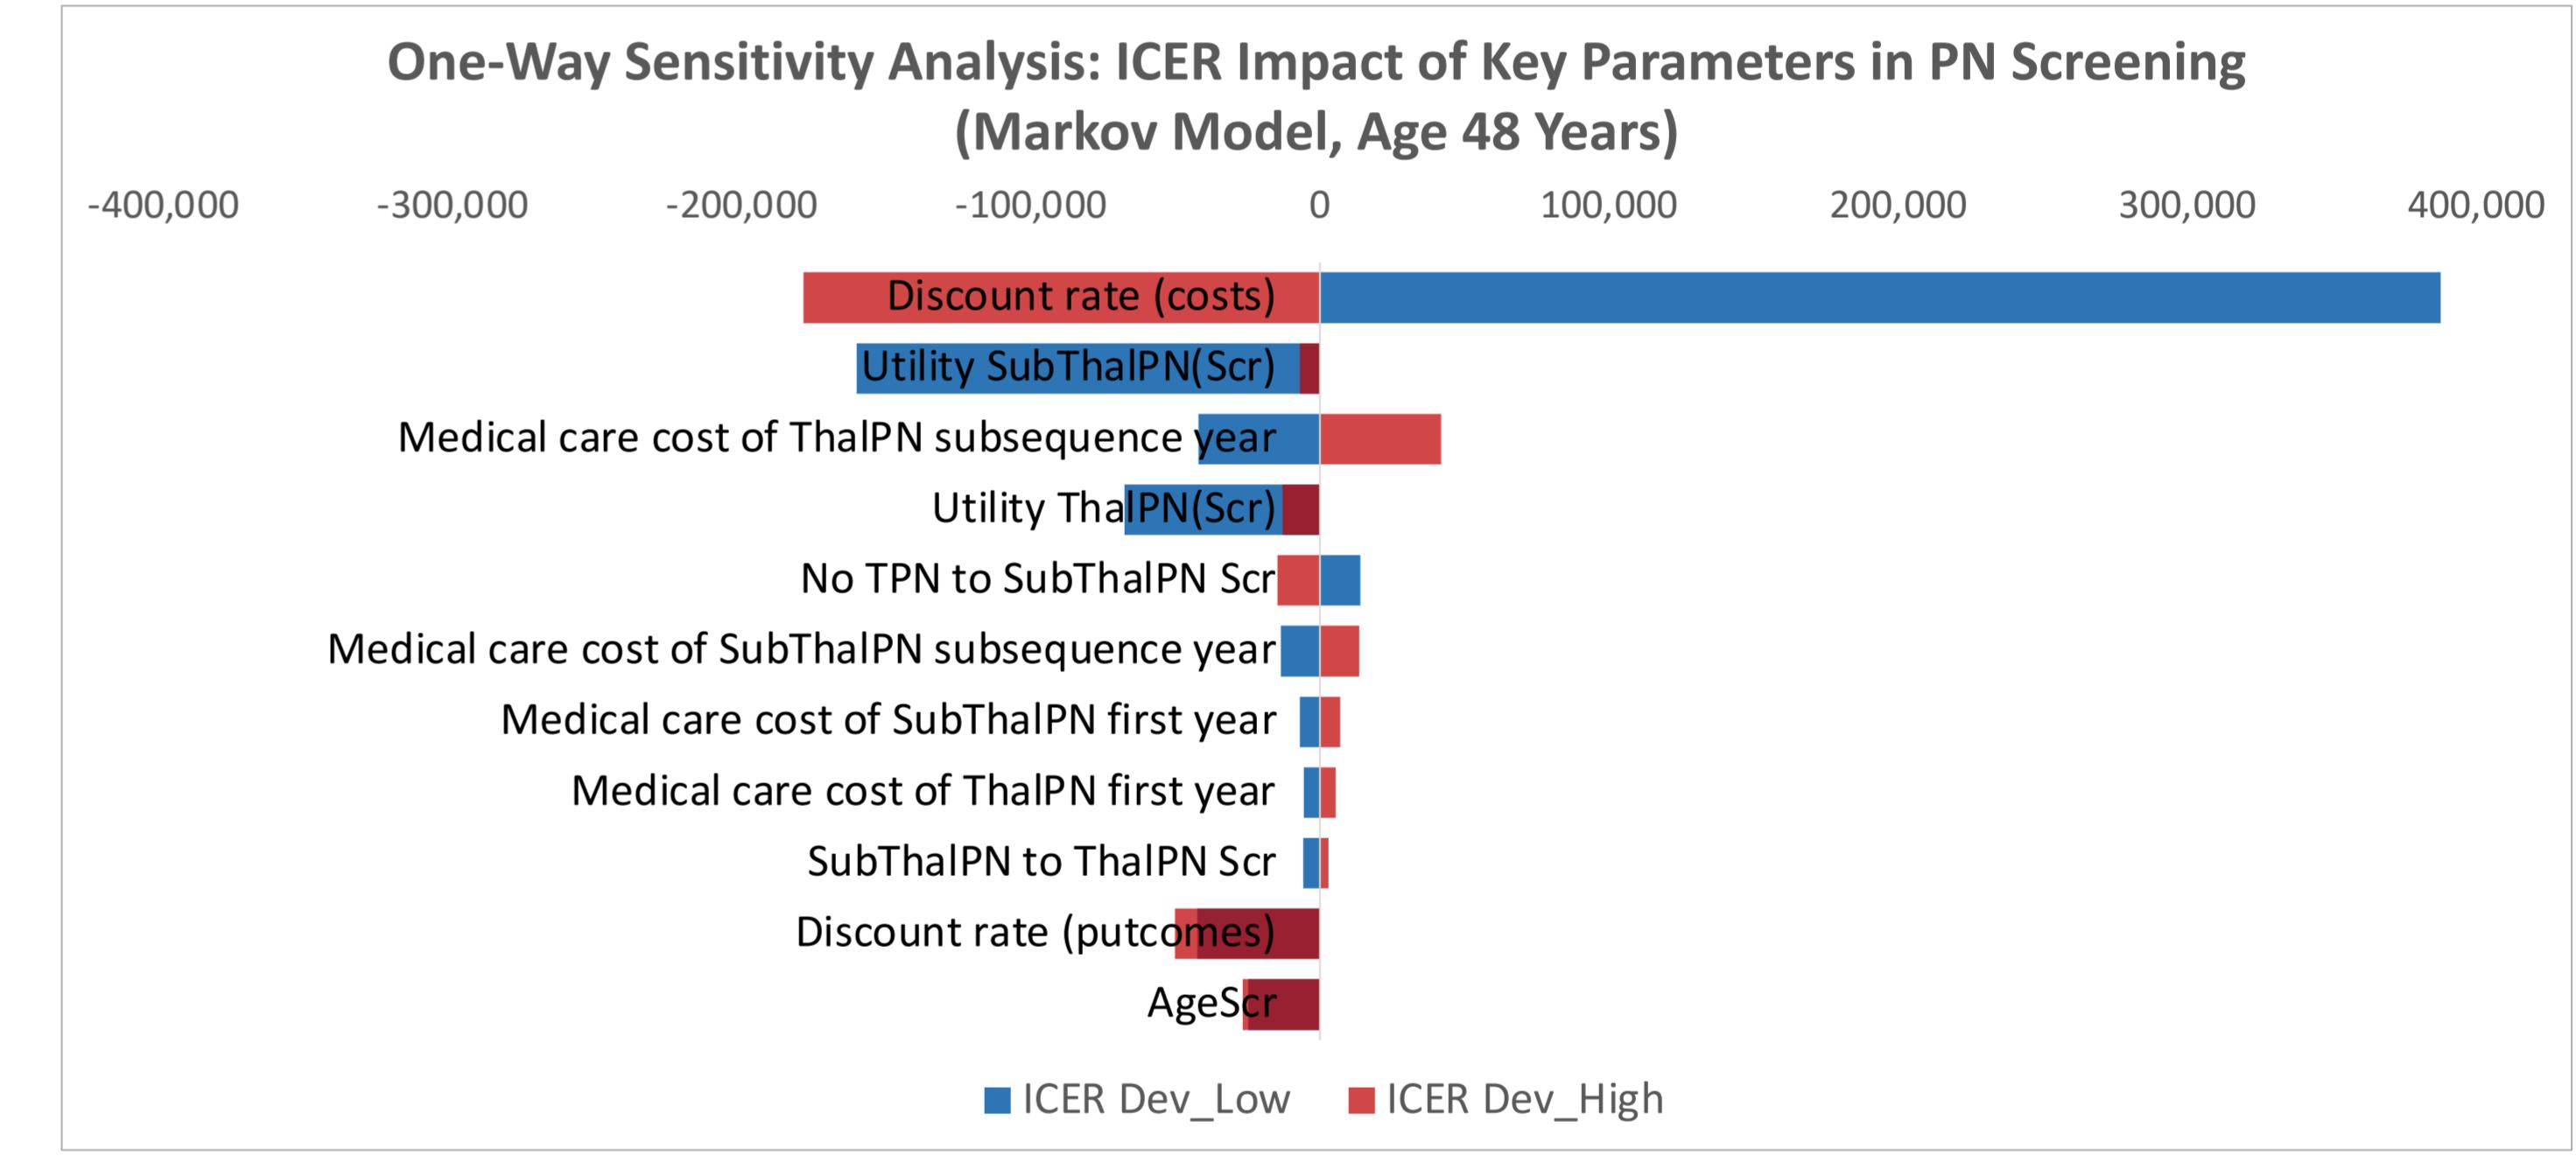

WTP Threshold: USD 11,161 per QALY

Outcomes: Incremental Cost-Effectiveness Ratio (ICER) in USD per QALY gained

Markov Model

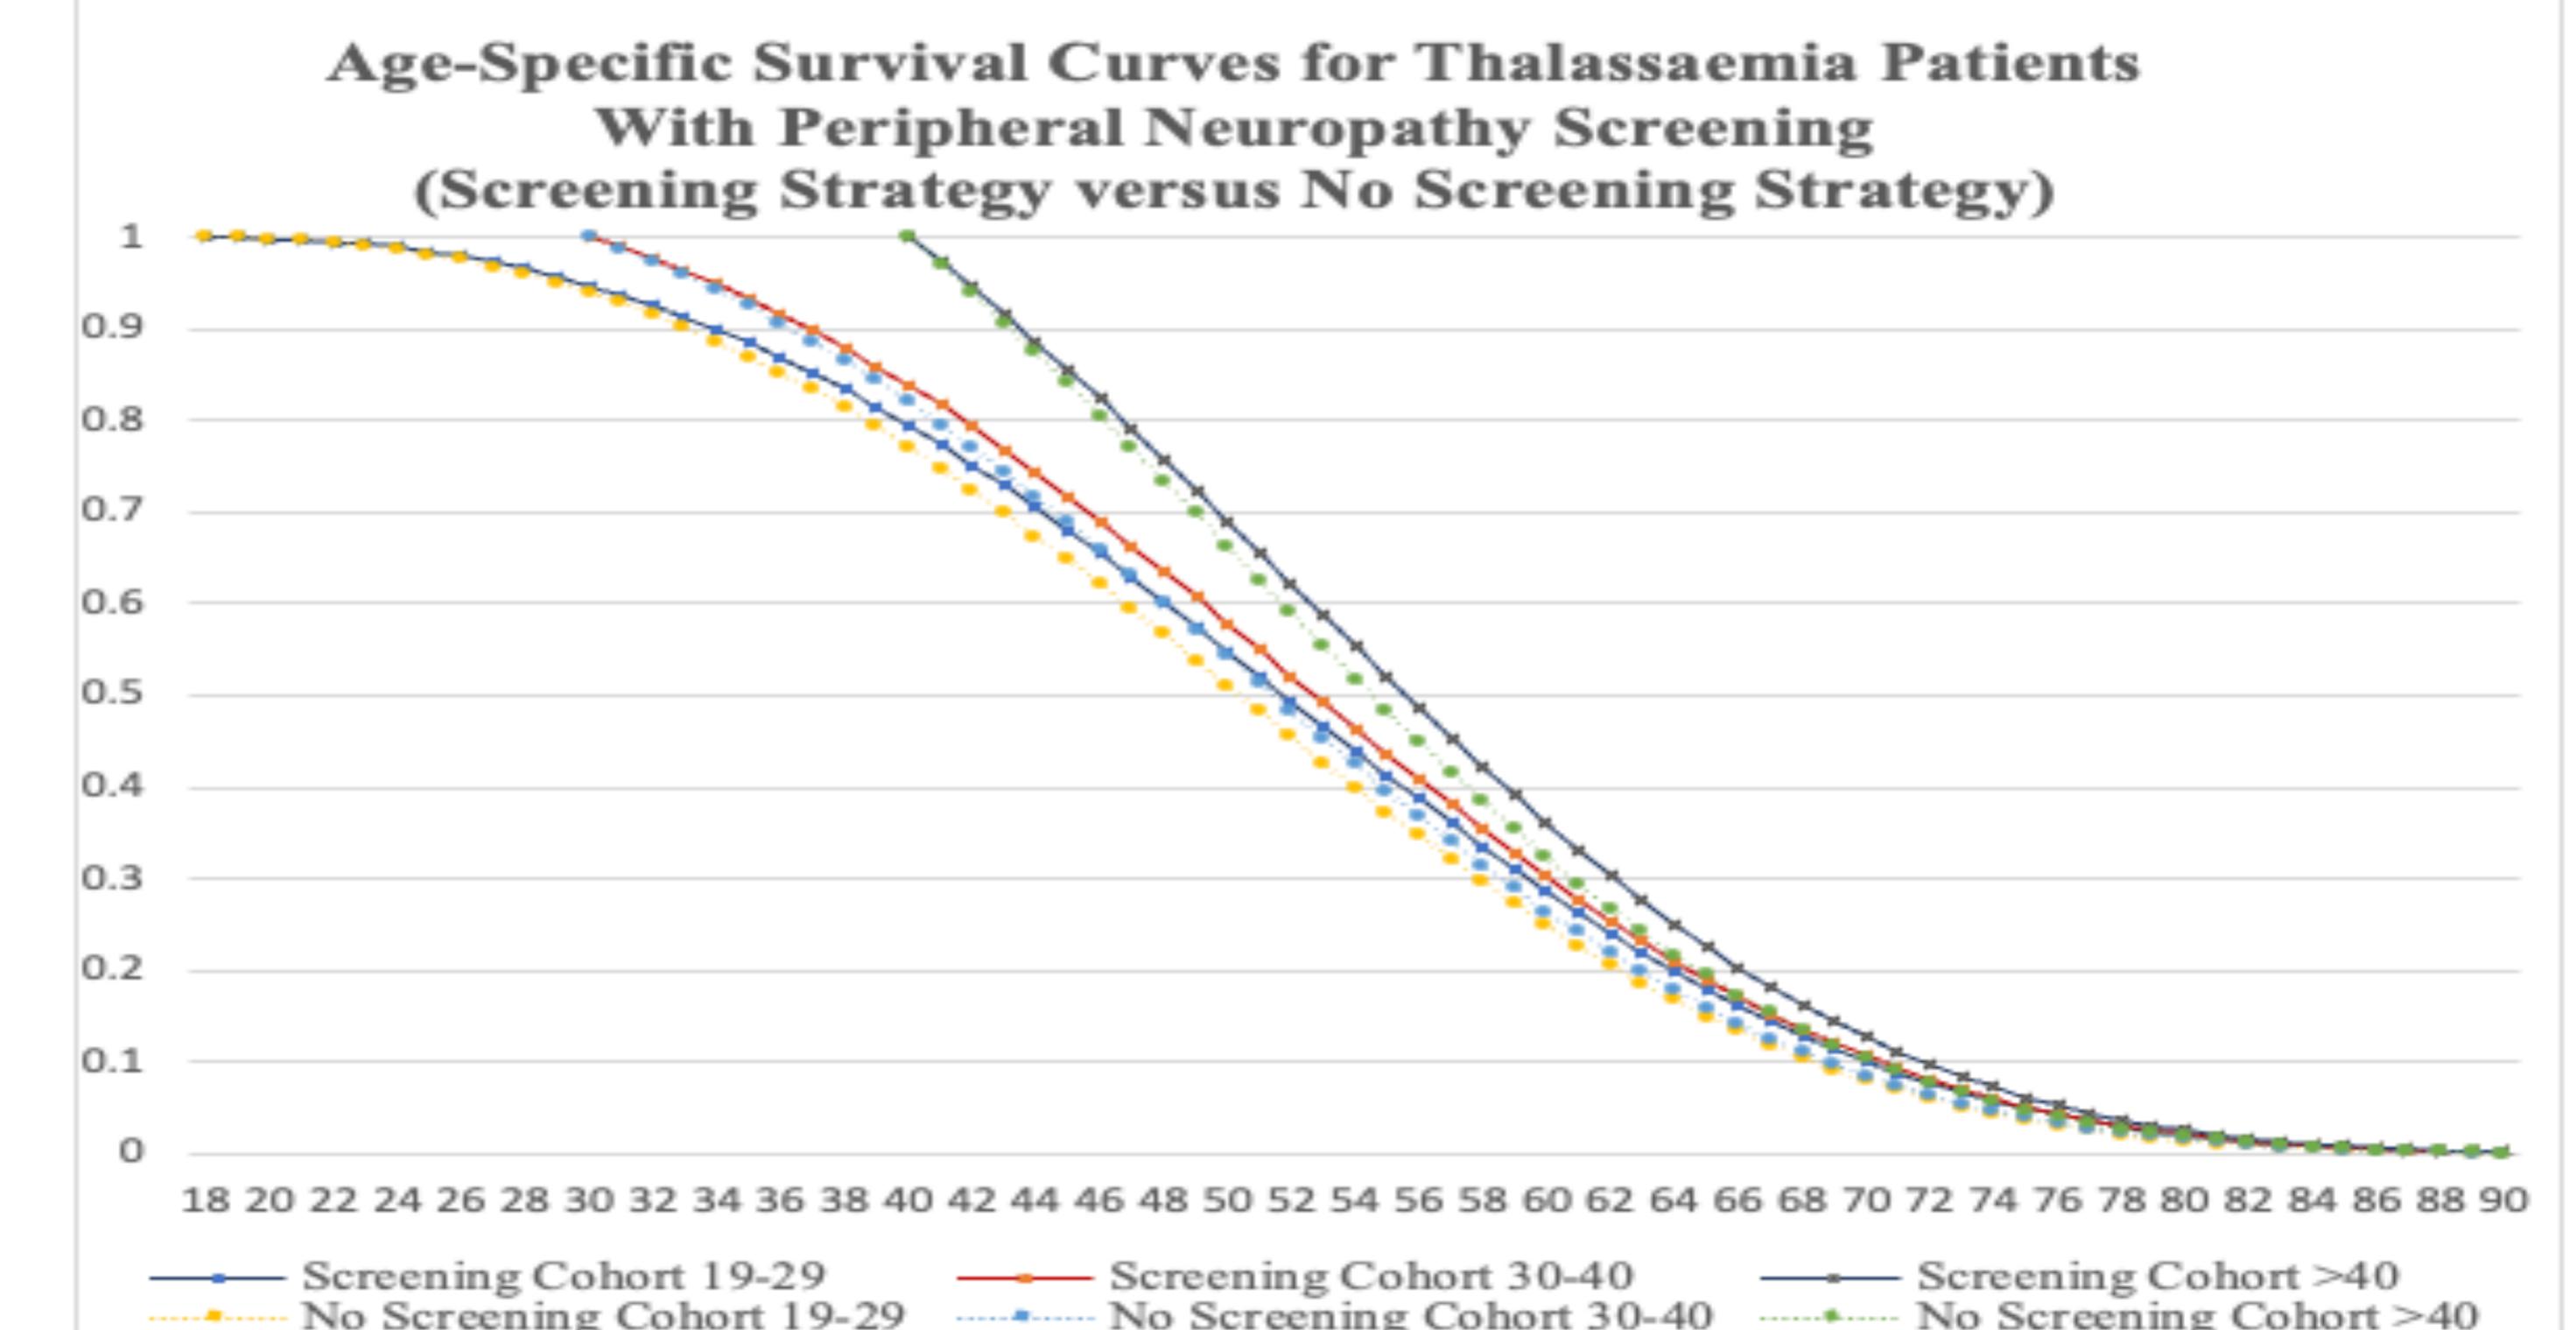

Abbreviation: SubThalPN, subclinical thalassemia peripheral neuropathy; ThalPN, Thalassaemia-associated Peripheral Neuropathy; tx, treatment

Abbreviations: AgeScr, Age of Screening; Dev, Deviation; ICER, Incremental Cost-Effectiveness Ratio; Neuropathy Disability Score; NSS, Neuropathy Symptom Score; PN, Peripheral Neuropathy; Scr, Screening; SubThalPN, Subclinical Thalassaemia Peripheral Neuropathy; ThalPN, Thalassaemia Peripheral Neuropathy

The ICER was **most sensitive** to the **discount rate, health utility for Subclinical Peripheral Neuropathy (SubThalPN), and annual medical costs**.

Survival curves by age cohort for thalassaemia patients under standard care (no peripheral neuropathy screening strategy) vs peripheral neuropathy screening strategy

The SRS strategy led to **life expectancy extensions** of **0.25%** for the 18-29 cohort, **0.27%** for the 30-39 cohort, and **0.32%** for the ≥40 cohort

Conclusion & Policy Implications

❖ This is the **1st economic evaluation** to support ThalPN screening in adult thalassemia patients.

❖ Systematic ThalPN screening is **cost-effective strategy** in Malaysia, delivering significant health benefits (QALYs) at an acceptable cost.

❖ **Earlier screening provides the greatest value.** These findings provide strong evidence to support the integration of SRS ThalPN into the standard of care for adults with thalassemia

Note: Results supersede those in the submitted abstract.
