November 2nd, 2021

Objective

- Explainable machine learning model to predict patient risk of emergency room (ER) visit and unplanned hospitalization within 30 days following a community oncology practice visit

Purpose

- Reduce unplanned hospitalization or ER visits
- Reduce overall cost of healthcare
- Improve Oncology Care Model (OCM) ER visit score
- Provide insights in patient risk

Patient Population & Demographics

Data was collected from US Oncology Network (USON) practices enrolled in the Oncology Care Model (OCM) program starting from July 1, 2016 to June 30, 2020 (Performance Periods 1-8)

Data Sources

- *iKnowMed* Electronic Health Records (EHR)
- OCM claims data

Inclusion/Exclusion Criteria

- Patients over the age of 65
- Patient with a cancer diagnosis
- Patients enrolled in the OCM program (on active cancer therapy)

Outcome

- Unplanned hospitalization/ER visit

Patient visit statistics

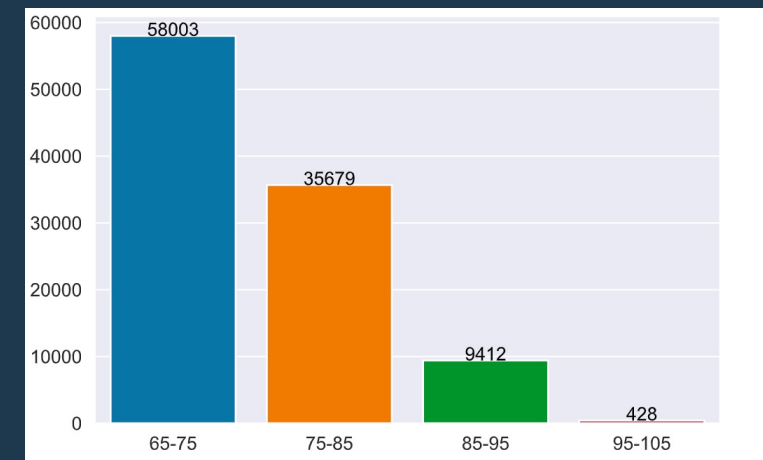

of Patients: 103,522

of Visits: 3,537,967

Gender

Age

Clinical Features

More than 300 features extracted

Labs	Duration of disease	ECOG Performance Status	Co-morbidities
Vitals	Pain	Weight loss percent	Cachexia
Demographics	Drugs	Treatment	Tumor Staging
Visit statistics	Metastatic disease	Cancer diagnosis	Derived features

Methodology: Data collection

**In-person
appointment
with a physician**

**Labs, vitals
results reported**

**Surgeries and
procedures**

**In-person
appointment
with a physician**

**Demographics, labs
and vitals data
collected from
patient**

**Physician makes
a cancer
diagnosis,
tumor staging**

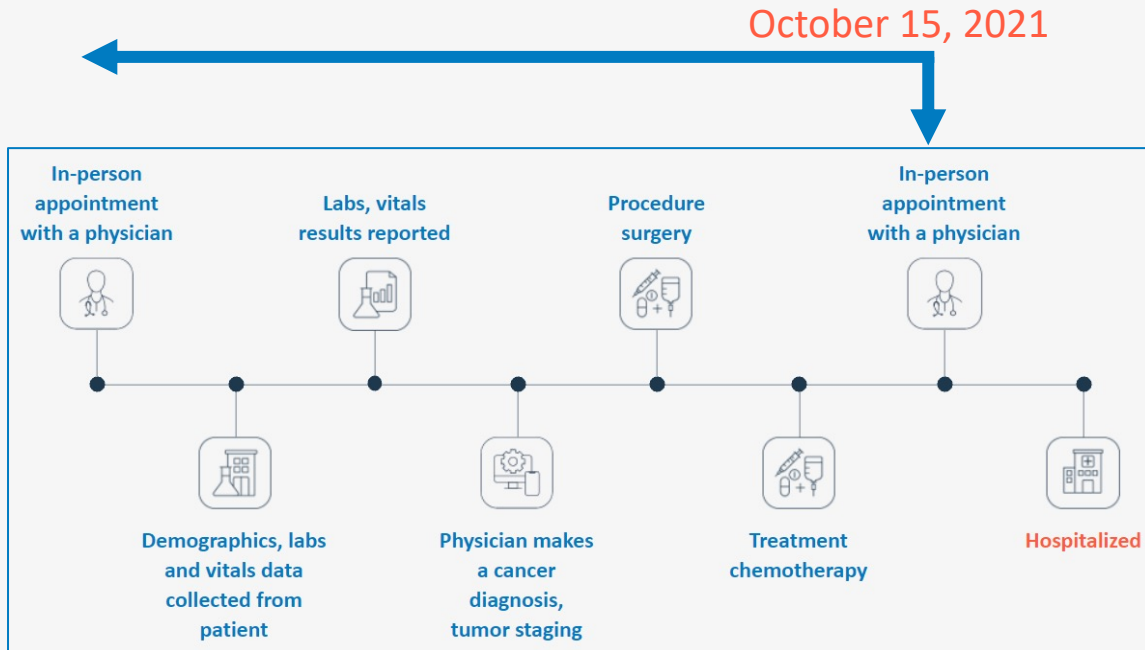

Treatment

**Hospitalization/
ER visit**

Methodology: Data transformation

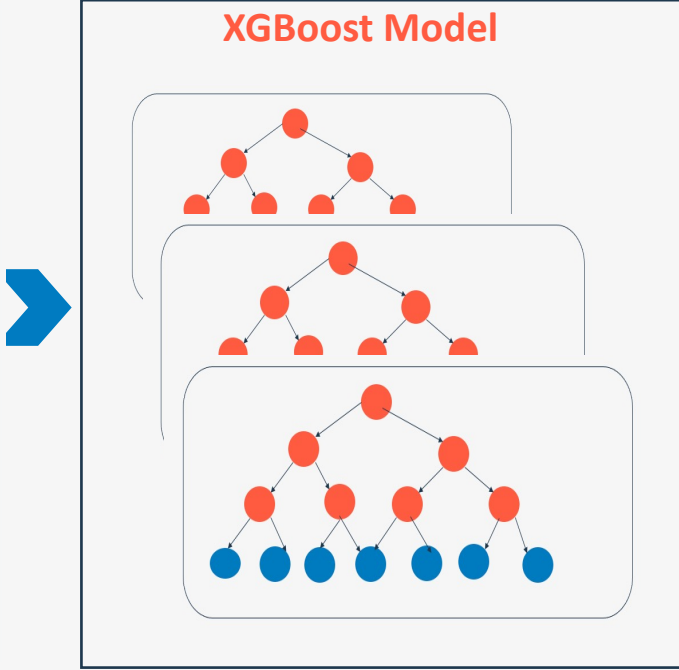

Extraction of a record, with current and historical data, for a unique combination of patient and visit date

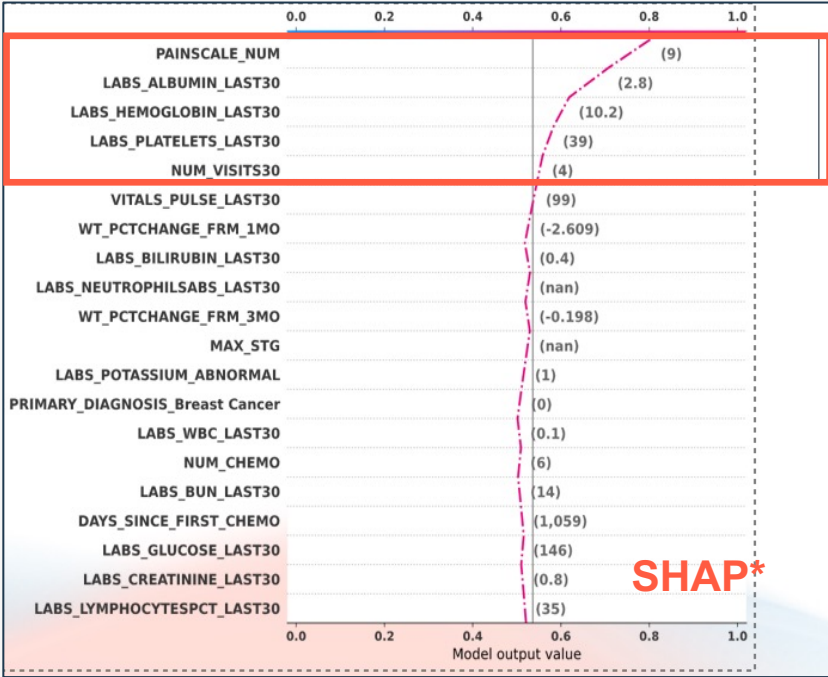

Patient ID	1234
Visit date	10/15/2021
Last Albumin in past 30 days	2.8
Last Hemoglobin in past 30 days	8.0
Weight loss percent	4%
Last Pulse in past 30 days	100
Metastatic	True (1)
...	...
Treatment in last 30 days	Chemotherapy
Hospitalization/ER visit in next 30 days	Yes

Methodology: Model Building, Evaluation & Explainability

Patient Id	Visit Date	Lab: Albumin in last 30 days	Lab: Hemoglobin in last 30 days	...	Hospitalized/ER visit
1023	9/01/2016				No
1134	10/20/2016	3.6	12.0		No
...			
		Training Set: 87%			
2342	9/19/2021	3	10		Yes
		Testing Set: 13%			
...					
1234	10/15	3.5	12.0		No

Probability of hospitalization/ER visit: 0.8

Probability of hospitalization/ER visit	Risk Bucket	Distribution of patients (%)
0 – 0.59	Lowest risk	81.65%
0.60 - 0.69	Risk category 1	5%
0.70 - 0.79	Risk category 2	8.06%
0.80 - 0.89	Risk category 3	4.74%
≥ 0.90	Risk category 4	0.55%

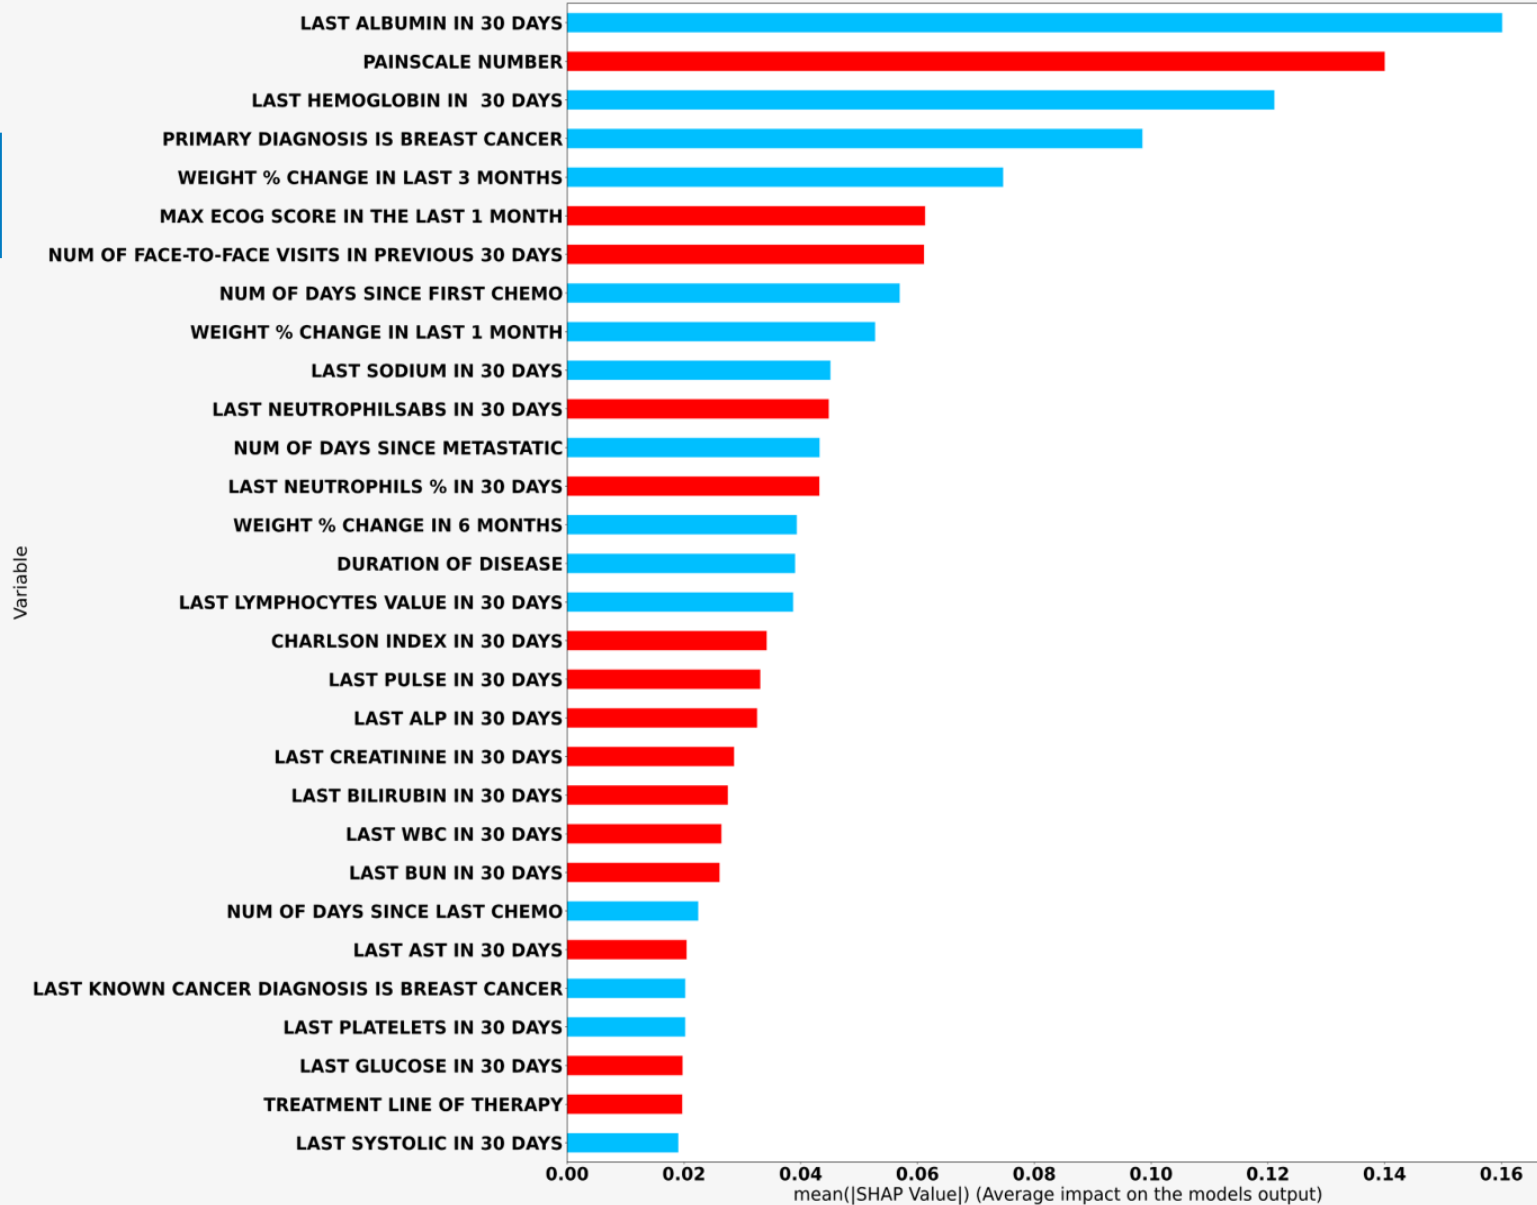

*SHapley Additive exPlanations

Results: Model Performance and Feature Ranking

Predicting 30 days in advance, no restrictions on cancer type/staging or treatment

Model	
Algorithm	XGBoost*
Area Under Curve (AUC)	72%
Sensitivity (Recall)	73% (Hospitalization/ER)
Specificity	60% (Non-Hospitalization/ER)
Threshold	50%

*eXtreme Gradient Boosting algorithm

Limitations

- The model can only be applied to patients greater than 65 years of age
- OCM claims data is updated every 6 months, thus permitting retraining only every 6 months
- Unable to use previous hospital admissions or ER visits information during the model building phase as it would be an important factor in predicting future hospitalizations

Conclusion

- Real-world data were harnessed and applied in an ML approach to establish a high-performing patient ER visit and hospitalization prediction model
- The next phase will include model deployment to several US Oncology Network practices to validate effectiveness in the real world
- Results will inform providers when a patient is at risk for an ER visit or hospitalization with the aim of improving the overall quality of oncology care and reducing admissions and ER visits

Acknowledgement

Thanks to the following members for their many discussions and support.

Definitions

- **Weight loss percent:**
 - Weight loss percentage of the current from the previous maximum weight in the last 1 month
- **Cachexia:**
 - No cachexia: weight change (± 1 kg) or weight gain
 - Pre-cachexia: weight loss $\geq 2\%$, but $< 5\%$
 - Cachexia: weight loss $> 5\%$ the last 1 month, OR weight loss $> 2\%$ the last 1 month + BMI < 20 kg/m²
 - Refractory cachexia: weight loss $> 15\%$ last 1 month + BMI < 23 kg/m² OR weight loss $> 20\%$ last 1 month + BMI < 27 kg/m²
- **Derived features:**
 - Engineered features from labs and vitals (e.g. the maximum value of a lab minus the minimum value during a time period, abnormal lab/vital values)
- **ECOG**
 - Measures the daily ability of the patient to care for themselves.

Methodology: Building an explainable predictive model for unplanned hospitalization

Explainability

- Explainability of Model:
 - Library: SHAP (SHapley Additive exPlanations)
 - Explanation: Top attributes for each individual hospitalization prediction

Probability of hospitalization/ ER visit	Risk Bucket	Distribution of patients (%)
0 – 0.59	Lowest risk	81.65%
0.60 - 0.69	Risk category 1	5%
0.70 - 0.79	Risk category 2	8.06%
0.80 - 0.89	Risk category 3	4.74%
≥ 0.90	Risk category 4	0.55%
