

# MIKEL BERDUD PHD, PROF. MIREIA JOFRE-BONET, DIMITRIOS KOUROUKLIS PHD, PROF. ADRIAN TOWSE Product Development Partnerships (PDPs) and Pharmaceutical Innovation

# INTRODUCTION

- Public and private investments can be mutually beneficial and improve the discovery and development of pharmaceutical innovations.
- There is an increasing trend in the number of Product Development Partnerships (PDPs) seeking to discover and produce **new vaccines** and new medicines in response to the global health threat posed by **infectious diseases**.
- Yet, the extant literature has not explored in depth the role of specific collaborations such as PDPs aimed at new drug development.
- The economic rationale of PDPs rests on the need to improve the economic incentives for the private initiative in areas that have low expected returns but high unmet need (e.g., neglected tropical and emerging infectious diseases, and rare diseases).
- Thus, PDPs arise as a potential solution by creating partnerships that combine public and/or non-for-profit scientific institutions, including private investors.
- A partnership with public institutions and/or philanthropic funders means that the **risk of failure is spread** among collaborators, which lowers the rate of return needed to attract private investment.
- In this research, we examine the impact of PDPs (legal entities, such as the Drugs for Neglected Diseases initiative) on stimulating pharmaceutical innovation.

# **DATA AND METHODS**

- We use the **G-Finder** and collect available data on legal PDPs for infectious diseases between 2015-2019.
- Additionally, we extract data from various other sources such as PharmaIntelligence, and Pubmed which include approval outcomes of new products and the scientific knowledge around the sub-disease area that the product aims to treat, respectively.
- We conduct a simple **OLS analyses** conditioned by data availability that explores the relationship between the likelihood of approval of a product funded by a PDP and the type of PDP, controlling for **product and disease characteristics**, as suggested by relevant literature.

## Legal entities- PDPs regression:

• Likelihood of  $approval_i = \beta_0 + \beta_1 lnR \& D_i + \beta_2 FunderType_i + \beta_3 DevStage_i + \beta_4 ProductType_i + \beta_5 Subdisease + \beta_4 ProductType_i + \beta_5 Subdisease + \beta_4 ProductType_i + \beta_5 Subdisease + \beta_5 Subdis$  $\beta_6 Science_i + \beta_7 Prevalence_i + \beta_8 R \& D * FunderType + \beta_9 R \& D * DevStage + \varepsilon_i$ 

# **DESCRIPTIVE AND EMPIRICAL RESULTS**

### PDPs (legal entities) and produc characteristics

Amount of R&D funding

Funder type: gov, philanthropic, multilateral agencies

Stage: discovery and pre-clinical

Product type: diagnostic platforn

Infectious sub-disease area

#### Science

R&D\*Funder type (gov, philanthr and multilateral agencies)

R&D\*Development stage (discove clinical)

# DISCUSSION

- Results indicate that **non-private funding** is especially **beneficial in** the early stages of drug development.
- An increase of the R&D levels across different development stages facilitates successful product development.
- Products in the early development stages are less likely to be approved.
- Specific funder and product types are especially important for the success of products funded by PDPs.
- PDPs including public sector R&D funds are more common in products with lower chances of being approved.
- The lower the scientific advances in sub-disease areas of infectious diseases are, the less likely a product is to be successful.
- Overall, the implementation of push policies and product focused policies in legal entities PDPs is important for facilitating innovation.

#### Funding allocation by R&D stage (legal entities-PDPs for infectious diseases)
