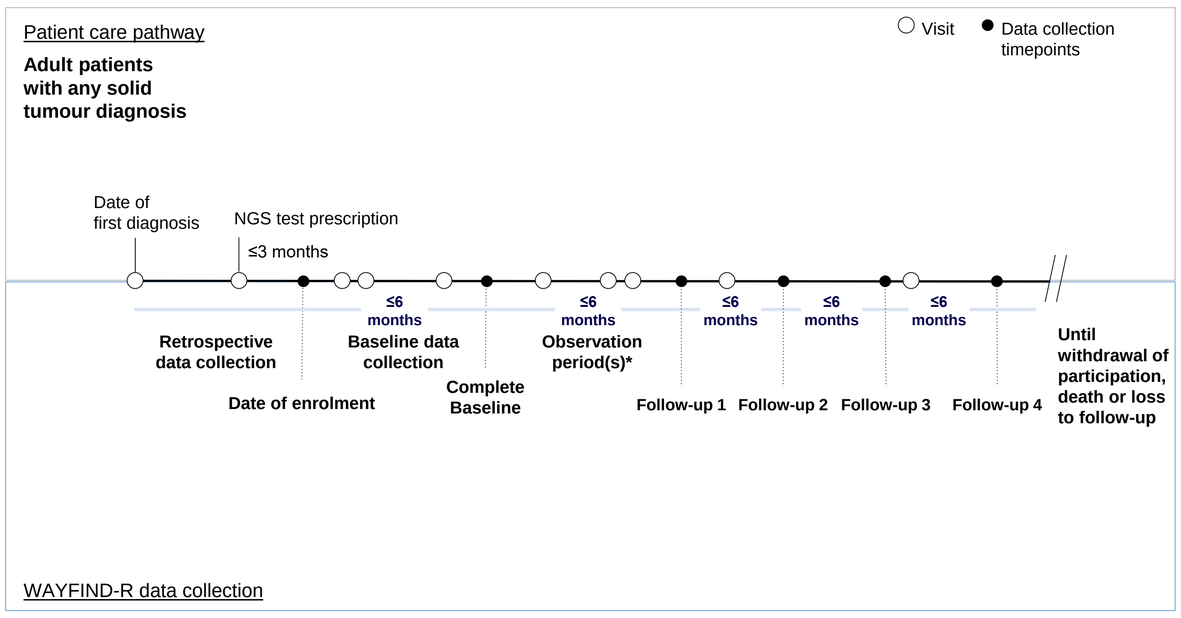
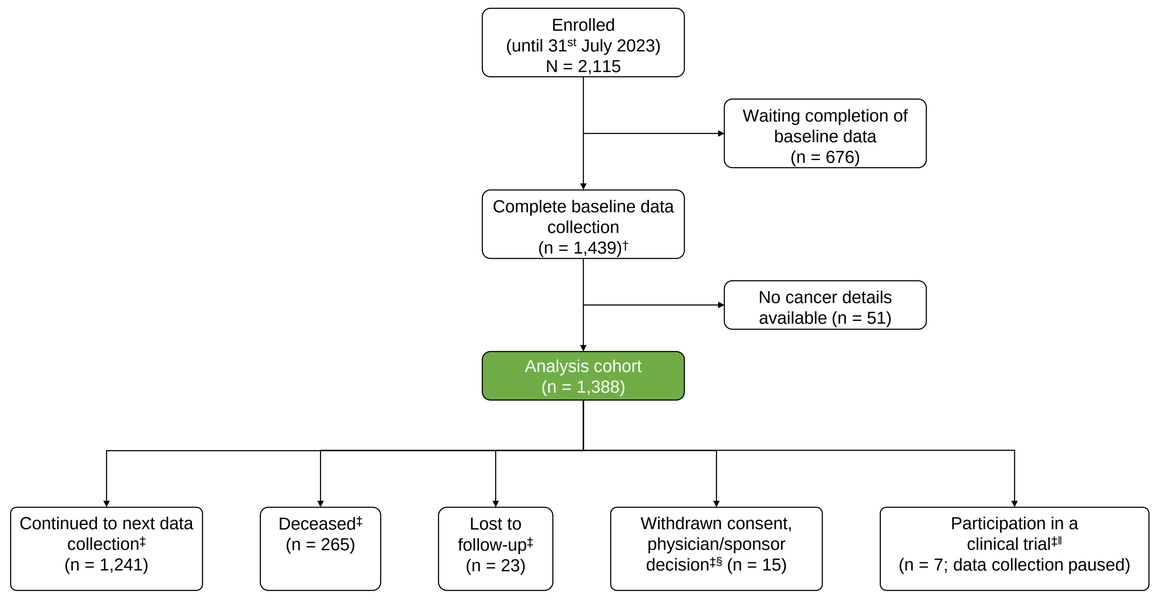
Supplemental Figure 1. WAYFIND-R data collection and analysis

A) Timeline for data collection



B) Patient attrition



*Observation periods are within 6 months of the first observation visit completion date and at least every 6 months thereafter.
†Complete baseline means that sites checked that they completed collection of baseline information on entry of the patient into the registry. It also signals if the patient will continue the participation in the registry.
‡Sum of totals might be higher than 1,388 as "Continue to next data collection" and "Death" can be selected as reason for end of study.
§Patients who ended participation still consented to have the data available in the database. Those that requested data deletion are not included in this analysis cohort.
‖For patients currently participating in a clinical trial, data collection is paused while enrolled in the clinical trial, and baseline information is available. These patients will resume follow-up once participation in the clinical trial is over.
