

CONCLUSIONS

- Manufacturers largely rely on **clinical data** in their **submissions** during **G-BA re-assessments**; however, **real-world evidence** (RWE) and **indirect treatment comparisons** (ITC) can also impact the outcome of re-assessments. Manufacturers could **leverage** such study approaches to increase the likelihood of a **higher added benefit** rating in the **re-assessments** of their drugs.

INTRODUCTION
<ul style="list-style-type: none"><li>German Federal Joint Committee (G-BA) regularly conducts re-assessments of drugs following the decision expiry or upon new data. We examined recent G-BA re-assessments to identify key drivers of the benefit re-assessment outcome, focusing on new evidence submitted by manufacturers.</li></ul>
METHODS
<ul style="list-style-type: none"><li>We identified G-BA re-assessments from January 2022 to June 2023 and analyzed added benefit ratings together with data package submitted to glean insights on key drivers of re-assessment outcomes.</li></ul>
RESULTS
<ul style="list-style-type: none"><li>G-BA re-assessed 16 drugs, 11 drugs in the oncology area; six drugs received orphan drug designation.</li><li>Added benefit rating did not change after re-assessments of 12 drugs; increased for three drugs, and decreased for another one.</li></ul>

RESULTS (continued)
<ul style="list-style-type: none"><li>New data was submitted for re-assessments of 12 drugs.</li><li>Three drugs improved their added benefit ratings in G-BA re-assessments. Mature randomized controlled trial (RCT) data, additional RCT, a meta-analysis of RCT, single-arm registries, and natural history studies were used as part of the new data package. Positive impact on overall survival, high magnitude of effect size, availability of long-term data, contextualization of single-arm data with historical comparisons, as well as rarity and severity of disease leading to acceptance of ITC were identified as key decision drivers (<b>Table 1</b>).</li><li>Absence of a comparator arm in submitted new studies or their insufficient follow-up time were among the reasons for no improvement in re-assessment outcomes.</li><li>The use of RWE in re-assessments was limited (five drugs) but appeared to contribute to improved re-assessment outcome for cerliponase alfa, together with the ITC and availability of long-term survival data. Designing RWE without adhering to G-BA's criteria of comparative evidence vs. appropriate comparator therapy and sufficient follow-up time was potentially a missed opportunity in drug re-assessments without a positive outcome.</li></ul>

TABLE 1. G-BA RE-ASSESSMENTS FOR DRUGS WITH NEW DATA SUBMITTED (January 2022 – June 2023)

PRODUCT	INDICATION	RE-ASSESSMENT			
		NEW DATA	USE OF RWE	OUTCOME	KEY DECISION DRIVERS
Cerliponase alfa	Neuronal ceroid lipofuscinosis type 2	<ul style="list-style-type: none"><li>Additional single-arm trial</li><li>Non-interventional observational study</li><li>Natural history external control data (local registry)</li><li>Compassionate Use Program data</li><li>Indirect comparisons (ITCs)</li></ul>	✓	Non-quantifiable → Major added benefit	<ul style="list-style-type: none"><li>Advantages in overall survival vs. historical comparison with high magnitude of effect size</li><li>Rarity and severity of disease (ITC accepted)</li><li>Availability of long-term data</li></ul>
Olaparib	Ovarian cancer	<ul style="list-style-type: none"><li>Final RCT data cut</li></ul>	✗	No added benefit → considerable	<ul style="list-style-type: none"><li>Advantage in overall survival</li></ul>
Abemaciclib	Breast cancer	<ul style="list-style-type: none"><li>New RCT</li><li>Meta-analysis of new and previously submitted RCT</li></ul>	✗	No added benefit → minor	<ul style="list-style-type: none"><li>Advantage in overall survival</li></ul>
Vandetanib	Medullary thyroid carcinoma	<ul style="list-style-type: none"><li>Post-authorization safety study</li></ul>	✓	Minor → no added benefit	<ul style="list-style-type: none"><li>Absence of a comparator arm</li></ul>
Voretigen Neparvovec	Hereditary retinal dystrophy	<ul style="list-style-type: none"><li>Final RCT data cut</li><li>Single-arm registry study (G-BA mandated)</li></ul>	✓	Considerable	<ul style="list-style-type: none"><li>Insufficient follow-up time of the registry study</li></ul>
Idebenone	Leber hereditary optic neuropathy	<ul style="list-style-type: none"><li>Two retrospective case series used as historical external control</li></ul>	✓	Non-quantifiable	<ul style="list-style-type: none"><li>Absence of a comparator arm</li></ul>
Lumacaftor/ Ivacaftor	Cystic fibrosis	<ul style="list-style-type: none"><li>New RCT with single-arm extension</li><li>Two single-arm comparator cohorts</li></ul>	✓	Non-quantifiable	<ul style="list-style-type: none"><li>Absence of a comparator arm</li></ul>
Abemaciclib	Breast cancer	<ul style="list-style-type: none"><li>Meta-analysis of two previously submitted RCTs</li></ul>	✗	No/minor added benefit*	<ul style="list-style-type: none"><li>No impact of new data on drug advantages in mortality, morbidity, health-related quality of life or safety</li></ul>
Daratumumab	Multiple myeloma	<ul style="list-style-type: none"><li>Final RCT data cut</li></ul>	✗	No/considerable added benefit*	
Pertuzumab	Early breast cancer	<ul style="list-style-type: none"><li>Final RCT data cut</li></ul>	✗	Minor added benefit	
Pertuzumab/ Trastuzumab	Early breast cancer	<ul style="list-style-type: none"><li>Final RCT data cut</li></ul>	✗	Minor added benefit	
Palbociclib	Breast cancer	<ul style="list-style-type: none"><li>New RCT</li><li>Meta-analysis of new and previously submitted RCT</li></ul>	✗	No added benefit	

BENEFIT RATING AFTER RE-ASSESSMENT: IMPROVED NO DIFFERENCE DECREASED
