Introduction

- The sensitivity of the EQ-5D descriptive system been improved by expanding the response levels from 3 to 5, and, by including additional dimensions: Bolt-ons.
- Approximately 50 Bolt-ons have been developed, and for most, there are both 3-level (**3L**) and five-level (**5L**) versions.
- Little is known about the added value and assumed improvement in measurement performance of the 5L bolt-ons compared to the 3L bolt-ons, and their sensitivity and responsiveness.

Objective

- To compare the psychometric properties of the 5-level versus 3-level bolt-ons for vision, breathing, tiredness, sleep, social relationships and self-confidence when added to the EQ-5D in a general population sample.

Methods

- POPUP** is an international, observational, longitudinal study collecting data from representative members of the general population (in the US, Canada, UK, Italy, Spain, Germany, Netherlands, Belgium) (**Figure 1**).
- Respondents entered demographic data, provided information on pre-existing medical conditions and filled out a set of PROMs, including the EQ-5D-5L plus 5L bolt-ons, and the EQ-5D-3L plus 3L bolt-ons, Hospital Anxiety and Depression Scale (**HADS**) and HUI-3.
- The following psychometric properties of the bolt-ons were assessed: redistribution properties, ceiling/floor profiles, informativity, divergent and convergent validity, agreement and known group validity.

Abbreviations: EQ-5D-3/5L: EurQoL 5-Dimension 3/5-Level, HADS: Hospital Anxiety and Depression Scale, HUI-3: Health Utilities Index-Mark 3, ICC: Intra-class correlation coefficients, LSS: Level Sum Scores, N: Sample size

Funding: This study was funded by argenx US, Inc. (Boston, MA, USA), and the EuroQoL Research Foundation (Rotterdam, The Netherlands).

Disclosures: The material in this poster has not been previously presented or published.

Table 5. Comparison of Pareto class changes between the EQ-5D-3L + 3L and EQ-5D-5L + 5L bolt-ons

For all respondents who are worse than 11111(1)	EQ-5D		EQ-5D + Vision		EQ-5D + Breathing		EQ-5D + Tiredness		EQ-5D + Sleep		EQ-5D + Social Relationship		EQ-5D + Self-Confidence	
	3L	5L	3L	5L	3L	5L	3L	5L	3L	5L	3L	5L	3L	5L
Improved	40%	38%	38%	31%	41%	37%	40%	36%	41%	35%	41%	36%	42%	37%
Mixed	9%	18%	15%	15%	12%	23%	14%	25%	13%	25%	13%	25%	14%	25%
No change	30%	19%	26%	28%	25%	16%	24%	13%	22%	13%	23%	14%	23%	15%
Worsened	21%	24%	22%	26%	22%	24%	22%	25%	25%	26%	23%	24%	22%	24%
Difference Improved	-2%		-7%		-4%		-4%		-5%		-4%		-5%	
Difference Mixed	9%		0%		11%		12%		12%		12%		11%	
Difference No Change	-10%		2%		-9%		-11%		-9%		-9%		-8%	
Difference Worsened	4%		4%		2%		3%		2%		1%		2%	

1. Redistribution properties

- The bolt-ons social relationships, tiredness and sleep, had the highest reporting of extreme problems (**Table 1**).
- A low percentage of inconsistent response pairs evidences excellent overall agreement between 3L and 5L bolt-ons.
- The proportion of inconsistent responses between the 3L and 5L pairs increased with the severity of problems.

2. Ceiling effect and Informativity

- There was a ceiling effect for both the EQ-5D-3L and EQ-5D-5L (45.4% and 32.3%, respectively) (**Table 2**).
- All 3L and 5L bolt-ons reduced the ceiling on average with 14% and 22% respectively, with the largest reduction achieved in vision, sleep and breathing.
- All 5L bolt-ons consistently showed higher absolute and relative informativity than 3L bolt-ons; largest improvement was seen for *social-relationships*, the smallest for *breathing*.

3. Agreement between 3L and 5L

- Intra-class correlation coefficients between rescaled Level Sum Scores of the EQ-5D-5L + bolt-ons and the EQ-5D-3L + bolt-ons showed strong agreement (ICC range 0.92-0.97, all p<0.001) (**Table 3**).
- Spearman's coefficient only showed strong correlation between the domain *Anxiety/Depression* and the bolt-ons *Social Relationships* (3L, 0.610; 5L, 0.642), and between *Self-confidence* and *Social relationships* (3L, 0.604; 5L, 0.658).

4. Validity and Sensitivity

- Both the 3L and 5L breathing bolt-ons showed strong correlation with relevant items of other instruments (r=0.66-0.68), except for vision (r=0.12-0.37).
- Longitudinal data showed that 5L bolt-ons picked up more changes over time – both improvements and worsening, compared to 3L bolt-ons (**Table 4**).
- EQ-5D-5L + 5L bolt-ons showed improved sensitivity, with more Pareto changes (improvements, worsening, mixed) over time than the EQ-5D-5L + 3L bolt-ons (**Table 5**).

Conclusion

- This is the first study in the literature to psychometrically validate a set of 3-Level and 5-Level bolt-ons in parallel.
- All 12 bolt-ons showed good measurement performance in assessing the health status of the general population, with the 5-Level bolt-ons showing superior psychometric performance.
- Our findings are useful for informing future bolt-on development, selection and testing, as well as instrument development beyond the EQ-5D
