Introduction and Aims

In 2022, 25.5 million Americans were diagnosed with diabetes and 107,000 died due to diabetes. The direct medical cost in 2022 were \$307 billion in the United States and excess medical cost per person in 2022 was \$12,022.¹

Our aims were to evaluate out-of-pocket costs, total health expenditures and health-related quality of life (HRQoL) between SGLT2i vs. GLP-1 **RA**, either alone or with metformin for patients with Type 2 diabetes mellitus $(T2DM).^{2}$

Methods

Data source: 2017-2021 Medical Expenditure Panel Survey

Study population: Patients with T2DM, \geq 18 years, on SGLT2i, GLP-1 RA, or in combination with metformin (Figure 1) (N=8,222)

Outcomes:

HRQoL: physical component summary (PCS) and mental component

summary (MCS) of Veterans Rand 12 (Table 2 and 3)

Expenditure: out-of-pocket payment (OOP), total health care expenditure

(Table 2 and 3)

Statistics Analysis:

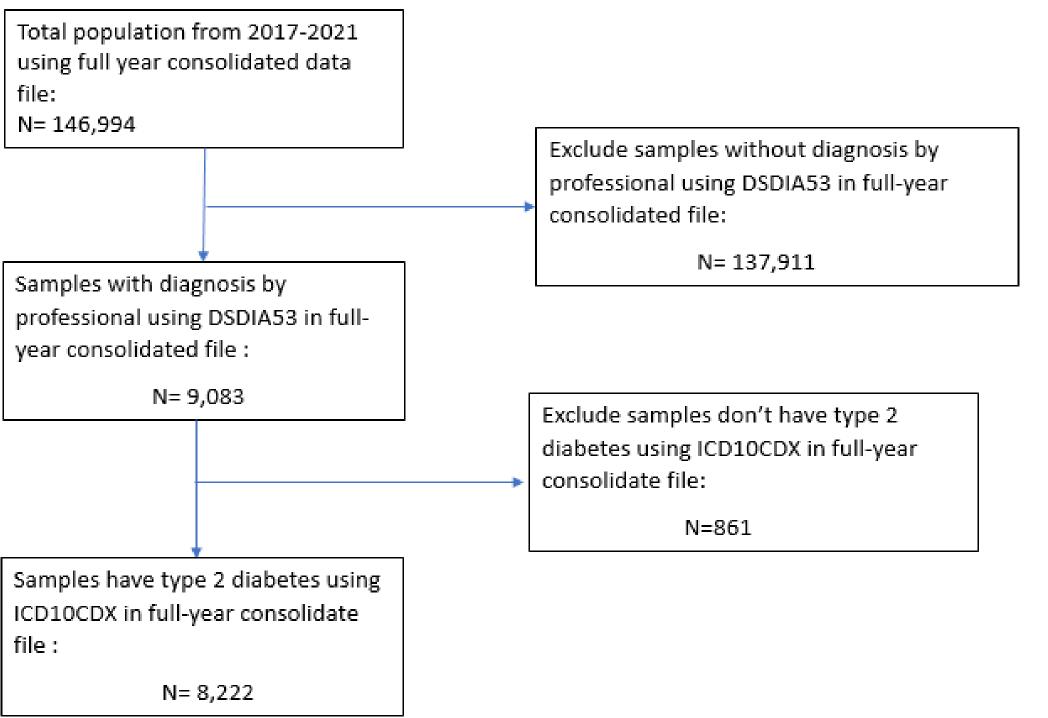

• Propensity score matching was performed to control selection bias

(Table 1).

- Mann-Whitney U test was used to compare health expenditures and HRQoL between treatments.
- Bonferroni adjustment was used to recalculate the P-value (Baseline \bullet characteristics: P = 0.0031. Total health expenditure or OOP, PCS, and

MCS: P = 0.017).

Donal Survey 2017 2021

Discussion & Limitations

AM

PHARMACY

There is significant difference for OOP between SGLT2i and GLP-1

RA either alone or in combination with metformin, but no difference

between total health expenditure, PCS, and MCS.

Strengths:

• real-world national representative data

• used propensity score matching to avoid bias.

Limitations:

• Timeline (2017-2021) included the COVID pandemic period,

during which there was reduced health utilization.

• Self-reported survey data, recall bias may occur

• MEPS doesn't have clinical outcomes (A1C, BG, and side effect). **Conclusions & Implications**

This study findings will help provide health care providers

guidance when they prescribe SGLT2i or GLP1 RA for patients with T2DM.

Lack of significant difference in PCS or MCS between GLP-1

agonists and SGLT2i raises concerns, since GLP-1 agonists have

higher OOP payments. Further investigation is recommended to

study the long-term impact on HRQoL and clinical outcomes. Reference
